AS A SMALL, BUT SINCERE, TRIBUTE

OF REGARD AND ESTEEM,

BY HIS OBLIGED,

AND HUMBLE SERVANT,

WILLIAM BAXTER.

*Botanic Garden, Oxford,*

May 15, 1843.

209919

Beautiful children of the woods and fields !  
That bloom by mountain streamlets 'mid the heather,  
Or into clusters, 'neath the hazels, gather—  
Or where by hoary rocks you make your bields,  
And sweetly flourish on through summer weather—  
I love ye all !

Beautiful flowers ! to me ye fresher seem  
From the Almighty hand that fashion'd all,  
Than those that flourish by a garden wall ;  
And I can image ye as in a dream,  
Fair modest maidens, nursed in hamlets small—  
I love ye all !

Beautiful gems ! that on the brow of earth  
Are fixed, as in a queenly diadem ;  
Though lowly ye, and meek without a name,  
Young hearts rejoice to see your buds come forth,  
As light e'erwhile into the world (ye) came—  
I love ye all !

Beautiful things ye are, where'er ye grow !  
The wild red rose—the speedwell's peeping eyes—  
Our own blue bell—the daisy, that doth rise  
Wherever sunbeams fall, or winds do blow ;  
And thousands more, of blessed forms and dyes—  
I love ye all

Beautiful nurslings of the early dew !  
Fann'd in your loveliness by every breeze,  
And shaded o'er by green and arching trees :  
I often wish that I were one of you,  
Dwelling afar upon the grassy leas—  
I love ye all !

Beautiful watchers ! day and night ye wake !  
The Evening Star grows dim and fades away,  
And morning comes and goes, and then the Day  
Within the arms of Night its rest doth take ;  
But ye are watchful wheresoe'er we stray—  
I love ye all !

Beautiful objects of the wild bee's love !  
The wild bird joys your opening bloom to see,  
And in your native woods and wilds to be.  
All hearts, to Nature true, ye strangely move ;  
Ye are so passing fair—so passing free—  
I love ye all !

Beautiful children of the glen and dell—  
The dingle deep—the muirland stretching wide,  
And of the mossy fountain's sedgy side !  
Ye o'er my heart have thrown a lovesome spell ;  
And though the worldling scorning may deride—  
I love ye all !

Sempervivum tectorum

Common House-leek. 4

Matthews Del & Sc.

Pubd by W Baxter Botanic Garden Oxford 1840

## SEMPERVI'VUM\*.

*Linnean Class and Order.* DODECA'NDRIA†, DODECAGY'NIA.

*Natural Order.* CRASSULA'C.E.E.‡, Decand.—Lindl. Syn. p. 63.; Introd. to Nat. Syst. of Bot. p. 161.—Rich. by Macgilliv. p. 514.—Loud. Hort. Brit. p. 516—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 97.—Mack. Fl. Hibern. p. 59.—CRASSULÆ, Juss. Dict. des. Sc. Nat. v. xi. p. 369.—SUCCULE'NT.E, Linn.—Vent. Tabl. v. iii. p. 271.—SEMPERVIVÆ, Juss. Gen. Pl. p. 307.—Sm. Gram. of Bot. p. 162.—ROSALES; sect. CRASSULINÆ; type, CRASSULACEÆ; Burn. Outl. of Bot. v. ii. pp. 614, 730, & 735.

**GEN. CHAR.** *Calyx* (fig. 1, *a*. and fig. 2.) inferior, of 1 sepal, concave, permanent, in from 6 to 12, more or less deep, uniform, fleshy, rather sharp-pointed, segments. *Corolla* (see fig. 1, *b*.) of the same number of petals as the segments of the calyx, and somewhat larger, spear-shaped, pointed, channelled, equal, spreading, withering. *Nectary* an occasional, very minute, entire scale, at the base of each germen, on the outer side. *Filaments* as many, or twice as many, as the petals, opposite to them, but not so long; when more numerous, partly alternate, awl-shaped, spreading. *Anthers* of 2 round lobes. *Germens* (see fig. 4.) as many as the petals, ranged in a radiating circle, oblong, pointed, compressed, each terminating in a spreading *style*, with a blunt *stigma*. *Capsules* (see figs. 5 & 6.) as many as the germens, and of the same figure, bursting along their upper or inner margin. *Seeds* numerous, minute, arranged along the inner margin, at each side.

The 6- to 12-cleft *calyx*; the *corolla* of from 6 to 12 petals; and the 6 to 12 *capsules*; will distinguish this from other genera in the same class and order.

One species British.

**SEMPERVI'VUM TECTO'RUM.** Roof Houseleek. Common Houseleek. Great Houseleek. Aygreen. Jupiter's Eye. Bullock's Eye. Jupiter's Beard. Great Sengreen.

**SPEC. CHAR.** Leaves ciliated. Offsets spreading. Petals entire and hairy at the margins.

170.—Luxf. Reig. Fl. p. 42.—Leighton's Flora of Shropshire, p. 205.—Mack. Cat. of Pl. of Ire. p. 47.; Fl. Hibern. p. 62.—*Sempervivum majus*, Ray's Syn. p. 269.—Johns. Ger. p. 510.—*Sedum tectorum*, Scop. Fl. Carn. (2nd ed.) p. 325.

LOCALITIES.—On walls, and cottage roofs, frequent, but perhaps not properly indigenous.

Perennial.—Flowers from June to September.

*Root* branched, fibrous. *Leaves* numerous, in tufts somewhat resembling a full-blown double rose, oblong, pointed, keeled, very succulent, the margins fringed with hairs, and generally tinged with red; the outer ones largest, the inner ones gradually smaller. *Offsets* on long cylindrical, slightly downy footstalks or runners (*sarmenta*), globular, composed of upright leaves lying over each other. *Flowering Stem* from the centre of one of the rosaceous tufts of leaves, from 9 to 12 inches high, upright, cylindrical, downy, clothed with many, alternate, sessile leaves, which are narrower and less succulent than the rest. *Flowers* large and handsome, of a pale rose-colour, in a terminal, many-flowered cyme, with spiked branches. Segments of the *Calyx* 12 or more, with a similar number of petals and stamens. Sir W. J. HOOKER says, that “the number of *stamens* is in reality 24, of which 12, inserted one at the base of each *petal*, are perfect; the rest alternating with the *petals*, small and abortive; some bearing *anthers*, open longitudinally and laterally, producing, instead of pollen, *abortive ovules*! others resemble a cuneate pointed scale, in the inside of which, upon a longitudinal receptacle, are likewise ranged abortive *ovules*, in the same manner as in the real germen; thus exhibiting the most complete transition from stamens to germens, in the same individual flower.”

This plant is a native of Europe on rocks, and on the roofs of houses, but is considered to be not truly wild in England, though inserted in all the Floras.

The juice of its leaves, either applied by itself, or mixed with cream, which is the best way of applying it, gives present relief in burns, and other external inflammations; it is also said to cure corns. Mixed with honey it is a useful application in the thrush. The Dispensatory describes a beautiful white highly volatile coagulum, formed of the filtrated juice of the leaves, with an equal quantity of rectified spirit of wine.

“*Sempervivum tectorum* is one of those species which are capable of growing in the most dry and exposed situations, often attracting its food from the atmosphere much more than from the scanty source that its roots have access to. It is usually planted by being enclosed in a lump of moist clay, which is stuck upon the naked tiles of a cottage. In such a situation, the young plant first secures itself by putting forth a few roots into the clay, and then gives birth to a number of little starry clusters of leaves, which surround their parent, and overshadow the place where the roots are to continue to develop; in the first instance, protecting it from the glare of the sun, and afterwards forming, by their decay, a soft vegetable mould, into which other roots may penetrate. They are enabled to effect this by the power which they, in common with all other plants, but in a higher degree, possess of abstracting from the atmosphere its impure air, or carbonic acid, which they convert from a gaseous into a solid state, by separating the charcoal or solidifiable portion, and liberating the vital air or oxygen that was combined with it. By this wonderous process, living plants become the great purifiers of the air we breathe, and it appears quite certain, that if it were not for them the earth would soon become so pestiferous as to be uninhabitable.” LINDLEY'S *Ladies' Botany*\*, v. ii. p. 106.

*Cotoneaster vulgaris.* Common Cotoneaster. L.

Russell Del.

Pub'd by W. Bantock, Botanic Garden, Oxford, 1860.

Matthews Sc.

## COTONEA'STER \*.

*Linnean Class and Order.* ICOSA'NDRIA †, DI-TRIGY'NIA.

*Natural Order.* POMACEÆ, Linn.—Lindl. in Tr. of Linn. Soc. v. xiii. p. 93.; Syn. p. 103.; Introd. to Nat. Syst. of Bot. p. 83.—Don's Gen. Syst. of Gard. and Bot. v. ii. p. 597.—ROSA'CEÆ; tribe, POMACEÆ, Juss. Gen. Pl. p. 333.—Sm. Gram. of Bot. pp. 171 and 172.—Rich. by Macgilliv. pp. 528 & 530.—Loud. Hort. Brit. pp. 512 & 513.—Hook. Brit. Fl. (4th edit.) p. 405.—ROSales; subtype, PYRIDÆ, Burn. Outl. of Bot. v. ii. pp. 614 & 695.

**GEN. CHAR.** *Flowers* polygamous, (i. e. some perfect and some barren on the same tree).—*Calyx* (fig. 1.) turbinated, with 5 short, egg-shaped teeth. *Corolla* (see fig. 2.) of 5, small, upright, nearly orbicular, concave petals (see fig. 3.), attached to the rim of the calyx. *Filaments* (see figs. 1 & 4.) 16 or more, upright, the length of the teeth of the calyx. *Anthers* roundish, 2-lobed. *Germen* (see fig. 1.) roundish. *Styles* 2 or 3, sometimes 4, smooth, shorter than the stamens. *Fruit* (see figs. 6 & 7.) turbinated, or pear-shaped, with its *nuts* (see figs. 7 & 8.) adhering to the inside of the calyx, but not cohering in the centre.

The polygamous flowers; the turbinated, 5-toothed calyx; the corolla of 5, small, upright petals; and the turbinated fruit, with its nuts adhering to the inside of the calyx, but not cohering in the centre; will distinguish this from other genera in the same class and order.

One species British.

**COTONEA'STER VULGA'RIS.** Common Cotoneaster. Dwarf Quince-leaved Medlar.

**SPEC. CHAR.** Leaves oval, entire, rounded at the base, downy beneath, deciduous. Calyx smooth. Peduncles slightly downy.

Engl. Bot. Suppl. t. 2713.—Hook. Fl. Lond. t. 211.—Lindl. in Tr. of Linn. Soc. v. xiii. p. 101.; Syn. p. 104.—Hook. Brit. Fl. p. 221.—Don's Gen. Syst. of Gard. and Bot. v. ii. p. 603.—Loud. ---

\* A sort of barbarous word, signifying quince-like. The quince was called *cotonea* by PLINY; and *aster* a corruption of *ad instar*, is used occasionally to express similitude. LONDON.

† See folio 100, note †.

## A Shrub.—Flowers in April and May.

A small *bush*, with spreading or partly recumbent, round, leafy, brown, smooth *branches*; downy, and somewhat angular when young. *Thorns* none. *Leaves* alternate, deciduous, egg-shaped, or broadly elliptical, blunt or pointed, entire, about an inch long, and three-quarters of an inch broad; green, smooth, and even above; white, cottony and veiny beneath. *Petioles (leafstalks)* short, downy, channelled above; each with a pair of spear-shaped, pointed, chesnut-coloured, fringed, deciduous *stipulas* at its base. *Peduncles (flowerstalks)* downy, from the same buds as the leaves, and always shorter than them; in wild specimens usually solitary and single-flowered; in cultivated ones often branched, with 3 or 4 flowers. *Bracteas* very small, red, spear-shaped, and pointed. *Flowers* (see fig. 2.) drooping, pale red. *Calyx (germen of some authors)* smooth, 5-cleft, its segments egg-shaped, blunt, incurved and woolly at the margin. *Petals* (see fig. 3.) small, but little larger than the segments of the calyx, nearly orbicular, white with a tinge of pink. *Filaments* (see figs. 4 & 5.) from 16 to 20, flat, and somewhat awl-shaped. *Styles* 3, sometimes 4, thread-shaped. *Fruit* (see figs. 6 & 7.) pear-shaped, crowned with the closed segments of the calyx. *Nuts* (see figs. 7 & 8.) of the same number as the styles, bony, entire, each bearing one style from the lower part of its inner angle.

It is a native of sunny parts of subalpine hills of Europe and of Siberia, but it was not known to be indigenous to Britain, till Mr. WILSON found it in a wild state at Ormshead, in 1825. A specimen of it is said to have been gathered wild, by J. W. GRIFFITH, Esq. of Garn, as long ago as 1783, but it appears it was laid by and forgotten. In a wild state it forms a shrub from 2 to 3 feet high; but when cultivated it will attain the height of 4 or 5 feet. Mr. LUDON says, that if it is grafted standard high on the hawthorn or the mountain ash, it will form a very curious, round-headed, pendent-branched tree, as may be seen in the garden of the Horticultural Society of London, and in the Hammersmith Nursery. The fruit, which ripens in July and August, is said to be first green, then orange, then red, and finally black. Its pulp is mealy, insipid, or slightly austere.

LINNAEUS recommends this shrub for making low hedges, in dry broken ground, as the roots run very deep into the earth; but, according to MR. CHRISTY's observations, it is liable to be browsed on by sheep.

Three varieties of it are cultivated, viz.  $\alpha$ . *erythrocarpa*;  $\beta$ . *melanocarpa*; and  $\gamma$ . *depressa*; the latter is rather spiny; in  $\alpha$  the fruit is red, and  $\beta$  black, when ripe.

The Natural Order POMACEÆ is composed of polypetalous, dicotyledonous *trees* or *shrubs*, with alternate, stipulate, simple, or compound leaves, and cymose, white or pink flowers. The *calyx* is bell-shaped, or pitcher-shaped, fleshy, surrounding the carpels, and adherent to them; *limb* 5-lobed, the odd segment posterior. The *corolla* consists of 5 unquiculate petals, inserted in the throat of the calyx, the odd one anterior. The *stamens* are indefinite, and are inserted in a ring in the throat of the calyx. The *ovaries* vary in number from 1 to 5, and adhere more or less to the sides of the calyx, and to each other. The *ovules* are usually 2, collateral, ascending, very rarely solitary. The *styles* are equal in number to the ovaries, each having a simple *stigma*. The *fruit* is a pome, consisting of the berry-like calyx and carpels. The *carpels* are catilaginous, spongy, or bony, of 2 valves, or indehiscent. The *seeds* are generally 1 or 2 in each carpel or cell (numerous in *Cydonia*, the Quince), upright, with a catilaginous (grisly), or bony testa (spernoderm), without albumen. The *cotyledons* are oval and fleshy; and the *embryo* upright, with a short, conical radicle.—The British genera contained in this order are, *Malus*.—*Crataegus*, t. 118.—*Pyrus*, t. 111.—and *Cotoneaster*, t. 402.

*Asparagus officinalis. common - Asparagus. II*

Matthew Delaune

Publ'd by the Botanic Garden Edinburgh 1820

## ASPA'RAGUS\*.

*Linnean Class and Order.* HEXA'NDRIA †, MONOGY'NIA.

*Natural Order.* ASPHODE'LEAE ‡, Dr. R. Brown.—Lind. Syn. p. 266.; Introd. to Nat. Syst. of Bot. p. 273.—Loud. Hort. Brit. p. 539.—Mack. Fl. Hib. p. 284.—Hook. Brit. Fl. (4th ed.) p. 423.—ASPARAGI, sect. I. Juss. Gen. Pl. p. 40.—Sm. Gram. of Bot. p. 71.—ASPARAGINEÆ, sect. I. Rich. by Macgilliv. p. 402.—ASPARAGEÆ, Macr. Man. Brit. Bot. p. 233.—LILIALES; sect. LILIACINÆ; type, ASPHODELACEÆ; Burn. Outl. of Bot. v. i. pp. 418, 425, & 427.—SARMENTACEÆ, Linn.

**GEN. CHAR.** *Calyx* none. *Corolla* (*perianthium* §) (see figs. 1 & 2.) inferior, of 6 deep, equal, oblong, spreading, deciduous petals, combined at the base. *Filaments* (see fig. 2.) 6, awl-shaped, smooth, inserted at the base of the petals, and much shorter than them. *Anthers* peltate, upright. *Germen* (fig. 3.) globular. *Style* short, with 3 furrows. *Stigma* in 3 spreading lobes, deciduous. *Berry* (see figs. 4, 5, & 6.) globular, of 1, 2, or 3 cells, and few seeds. *Seeds* (fig. 7.) externally globose, with a horny *albumen*, and a transverse *embryo*, far out of the centre.

The inferior, deeply 6-parted *corolla*; the globose, 1- to 3-celled, few-seeded *berry*; and the short *style*, with a 3-lobed *stigma*; will distinguish this from other genera, without a calyx, in the same class and order.

One species British.

ASPA'RAGUS OFFICINA'LIS. Common Asparagus. Sperage.

**SPEC. CHAR.** Stem herbaceous, round, upright, without prickles. Leaves bristle-shaped, fasciculate, flexible. Peduncles jointed in the middle.

Marshes near Thombury: Mr. DYER. Sea Mills: Miss WORSLEY, in N. B. G.—*Hants*; At Christ Church; and Freshwater, Isle of Wight: Dr. PULTENEY.—*Kent*; By the Thames near Gravesend: Mr. J. SHERARD, in *Ray's Syn.*—*Lincolnsh.* In the rich Meadows near Holbeach, Long Sutton, &c.: Sir J. BANKS, in B. G. Cliff near Hemswell, Spittal: *Lond. Fl.*—*Norfolk*; Buigh, near Beccles: Mr. WOODWARD, in B. G. Sea-shore, opposite the Monument: Mr. WOODWARD, in N. B. G.—*Somersetsh.* In marshes below Look's Folly, two miles from Bristol: Mr. NEWTON, in *Ray's Syn.* Sand banks at Steart and Burnham, from 3 to 5 feet high, when in blossom: N. B. G.—*Surrey*; Near the Mill, Waddon; probably not wild: *Lond. Fl.*—*Wales*. Anglesea; On a sandy hillock below Llanfaelog: Rev. H. DAVIES.—*Glamorgansh.* Meadows between Cowbridge and the sea; and about Cardiff: Dr. TURTON.—*Scotland*. *Haddingtonsh.* Links near Gosford: Mr. E. MAUGHAN, in *Fl. Edin.*

### Perennial.—Flowers in July.

*Root* somewhat creeping, with long, stout, fleshy fibres; the crown densely scaly. *Stems* annual, upright, round, smooth, stiff, naked and scaly below; much branched, and leafy above; from a foot to 18 inches high in a wild state, in a cultivated one much higher. *Leaves* tufted, small, bright green, bristle-shaped, pointed, smooth. *Stipulas* solitary, membranous, spear-shaped, sometimes with 2 smaller ones within, the uppermost short and torn. *Flowers* axillary, 2 or 3 together, bell-shaped, drooping, yellowish-green; each on a slender, jointed, drooping peduncle. *Style* very short. *Berries* globular, bright scarlet, about the size of currants, not eatable. *Seeds* black. *Plants* sometimes dioecious, or even polygamous. A variety, in which the foliage is procumbent, is described by DILLENIUS in *Ray's Synopsis*, as growing on the sandy banks by the sea-side between Langwyfan and Llanfaelog; and also below Look's Folly, two miles from Bristol. It has been observed since, in the former station, by the Rev. H. DAVIES.

Asparagus is a native of most other parts of Europe as well as of England, and also of Japan. In that excellent and most useful work of Mr. LOUDON'S, the *Encyclopædia of Gardening*, we are informed, that “many of the steppes in the south of Russia and Poland are covered with this plant, which is there eaten by the horses and oxen as grass.” It is much cultivated, especially about London, for the sake of the young sprouting stems, which are universally esteemed for their flavour and nutritious qualities. It is principally served to table on a toast, or ragou'd. It also makes an excellent soup, and is often cut small and sent to table as a substitute for green peas.

A very pretty little insect of the Beetle kind, *Chrysomela Asparagi*, feeds upon the plant.

LOCALITIES.—In moist meadows and pastures; frequent.

Perennial.—Flowers in August and September.

Root spindle-shaped, wrinkled, blackish on the outside, white within. Herb smooth, dark green. Stem from 2 to 3 feet high, upright, branched, round, striated, leafy, solid, often of a reddish colour near the ground. Leaves twice or thrice pinnate; their leaflets elliptic-spear-shaped, entire; either undivided, or separated, almost to the base, into 2 or 3 segments of the same shape and size. General Umbels of about seven unequal rays; partial ones small, of from twelve to twenty rays, and upwards. General Involucrum of one or two leaves, frequently wanting; partial Involucrums of several strap-shaped leaves, which are often deep purple or black at the ends. Flowers pale yellow or greenish white, with a thin floral receptacle, at first green, and upright, but as the fruit advances, spreading, depressed, confluent with the broad convex bases of the styles, and assuming their reddish colour. Fruit roundish egg-shaped.

It is a native of humid meadows in most other parts of Europe as well as in Britain; and also in Siberia. The whole plant is fetid when bruised, and has been supposed to give a bad flavour to milk and butter; but Sir J. E. SMITH says cattle certainly do not eat it, except accidentally, or in small quantities, sufficient perhaps to have the effect in question. Where this plant abounds in pastures, it may be found partially cropped, though generally left almost entire.

---

Who that has *thought*, but must confess  
Whatever he beholds is right?  
Thou lov'st the MAKER not, unless  
His works delight.

Who that has *eyes*, but needs must read,  
Traced on each leaf of every tree,  
His wond'rous name, who all decreed,  
And bade all be!

Hist. v. iii. pt. i. lib. 25. p. 81.—*Carlina sylvestris major*, Johnson's Gerarde, p. 1159.

LOCALITIES.—In dry hilly pastures and fields; frequent.

Biennial.—Flowers in June and July.

*Root* tapering, small, with a few stiff fibres. *Stem* upright, from 10 to 15 inches high, tumid just above the root, cylindrical, ribbed, leafy, purple, slightly downy, somewhat corymbose. *Leaves* alternate, more or less stem-clasping, spear-shaped, sinuated and wavy, green, veiny, rigid, the margins armed with numerous yellow prickles; smooth above, usually downy or woolly beneath. *Flowers* rather handsome, terminal, solitary, of a singular aspect, and not inelegantly variegated. *Involucrum* imbricated, more or less cottony; *outer scales* (fig. 1, a.) spear-shaped, acute, lax, their margins armed with simple and branched prickles; *innermost scales* strap-shaped, unarmed, entire, membranous, cream-coloured, polished, forming a ray to the flowers, hygrometrical, changing their position according to the moisture of the atmosphere. *Florets* numerous, red at the top, straw-coloured below. *Anthers* with 2 bristles at the base. *Stigmas* yellow. *Pappus* (see fig. 5.) sessile, feathery, awl-shaped at the base, a little above which it usually divides into 3 or 4 bristle-shaped, feathery branches (fig. 4, e.). *Scales* of the *Receptacle* as long as the florets, divided in the upper part into several bristle-like segments (fig. 7).

This species is said to be a native throughout the whole of Europe, in dry, sandy pastures. Its presence indicates a very barren soil. When it is confined to local spots hand-weeding, Mr. HOLDICH says, may be serviceable; but when spreading generally, he recommends the farmer to lose no time in using the plough, harrow, and horse-hoe, and a judicious course of cleansing crops before returning the land to permanent pasture.

According to the observations of LINNÆUS, goats eat this plant, but cows refuse it. It was formerly much extolled as a remedy in hysterical cases, but it has now wholly fallen into disuse. Its flowers expand in dry, and close in moist weather, and, as they retain this property for a long time, they are often fixed against the cottage doors in Germany, France, and Spain, by way of hygrometers.

The spreading tuft of down with which the seeds are crowned, and by which they are wafted through the air, did not escape the notice of OSSIAN, who fancifully describes "the Zephyrs\* sporting on the plain, pursuing the Thistle's beard."

The whole plant is of a dry and rigid habit, and after it has perfected its seeds turns white and shrivels, in which state it often remains through the winter, or even second year, as LINNÆUS observes, a mournful spectacle.

§ See folio 27, a.

**LOCALITIES.**—In meadows, pastures, and waste places; common.

**Perennial.**—Flowers from June to September.

*Root* strong, tapering, running deep into the ground; brown externally, white and milky within. *Stems* several, a foot or more high, branched, spreading, somewhat angular, smooth, rather glaucous, without leaves, but furnished with small, scattered, spear-shaped scales. *Leaves* all radical, spreading in a circle on the ground, flattish, oblong, bluntnish, runcinate, the segments and sinuses rounded, rough with long white simple hairs, which proceed from little prominent points. *Peduncles* (*flowerstalks*) longish, hollow, a little thickened upwards, clothed with small, scattered, appressed, awl-shaped *bracteas*. *Flowers* rather large, solitary, bright yellow. *Involucrum* of several, imbricated, unequal scales (see fig. 1, a.); the outer of which are short, the inner ones longer, spear-shaped, pointed, strongly keeled, smooth except the keel which is rough, with rather long, white, rigid hairs, and a few shorter black ones towards the apex; the margins of the upper half minutely fringed, densely so at the apex. *Florets* (see fig. 2.) strap-shaped, blunt, deeply and acutely 5-toothed at the summit, tubular at the base, with a tuft of yellow hairs at the orifice of the tube. *Seeds* oblong, striated, tawny. *Pappus* (see fig. 5.) of all of them stalked and feathery. *Scales of the Receptacle* (see fig. 6.) thin, membranous, spear-shaped, taper-pointed, keeled, distantly fringed in the upper part.

A dwarf variety, with a simple stem, or with only one flower, and that almost sessile on the side, sometimes occurs in barren soil.

The flowers of this species, according to the observations of LINNAEUS, open between seven and eight o'clock in the morning, and close at two in the afternoon. Dr. WITHERING says, it is the *Porcellia* of old authors, supposed to be a favourite food with pigs; though probably not more so than some others of the same class; as *Swines' Sucory* (*Lapsana pusilla*), and *Sow-thistle* (*Sonchus Oleraceous*, t. 147).

“ Oh, flowers! sweet goodly flowers! Ye were loved, in times of old,  
And better worth were crowns of flowers than crowns of beaten gold.  
They wore ye at the marriage-feast, when merry pipes were blown;  
And, o'er their most beloved dead, fit emblems, were ye strewn!  
—The Poets ever loved ye, for in their souls ye wrought,  
Like seas, and stars, and mountains old, enkindling lofty thought!  
But—greater far than all—our blessed LORD did see  
How beautiful the lilies grew, in the fields of Galilee:—  
Consider now these flowers, He said, they toil not, neither spin,—  
And God, himself, the garment made which they are clothed in;—  
In the perfectness of beauty each several flower is made,  
And Solomon, in all his pomp, was not like them arrayed:—  
They are but of the field, yet God has clothed them as ye see!—  
Oh, how much more, immortal souls, will He not care for ye!”

MARY HOWITT.

Nat. Arr. v. ii. p. 506.—*Seseli Amomum*, Scop. Fl. Carn. (2nd edit.) v. i. p 213. N°. 355.—*Cicuta Amomum*, Crantz. Fl. Austr. p. 96.—*Petroselinum macedonicum Fuchsii*, Johnson's Gerarde, p. 1016.

LOCALITIES.—In rather moist spots under hedges, where the soil is marly or chalky. More or less frequent in most counties in England and Wales. Very rare in Scotland, the only localities given for it, in Mr. WATSON'S *New Botanist's Guide*, being Hirsell Lough; and near Coldstream, Berwickshire. I believe it has not been found at all in Ireland, at least it has not found a place in Mr. MACKAY'S excellent Flora of that country.

### Biennial.—Flowers in August.

*Root* tapering, with many lateral fibres. *Stem* 2 or 3 feet high, upright, with numerous, alternate, rigid, wiry branches, a little zigzag, striated, smooth, leafy. *Leaves* dark green, smooth, pinnate; the odd *leaflet* lobed; all somewhat egg-shaped, deeply cut and serrated; those of the upper leaves narrower, sharper, more divided, 3-lobed, often pinnatifid. *Umbels* numerous, terminal, solitary, drooping before flowering, upright when in flower, each of 4 unequal rays, seldom more, the middle one the shortest; *partial umbels* also of few and unequal rays. *Universal Involucrum* of from 2 to 4, spear-shaped, small, and slender leaves; *partial one* of about 4 leaves, still smaller. *Flowers* (see fig. 1.) white or cream-coloured, all regular and fertile. *Calyx* scarcely discernable. *Petals* broad, roundish or inversely heart-shaped, with an incurved point. *Styles* very short, each with a large globose base; and blunt, spreading, permanent *stigmas*. *Fruit* roundish egg-shaped, broad, short, moderately compressed. *Carpels* half egg-shaped, each with 3 dorsal, not very prominent, ridges, at a distance from the border.

This plant is a native of France, Italy, Sicily, Greece, &c., as well as of England. The whole herb has a peculiar nauseous scent when bruised. The dry *seeds* are warm and aromatic to the taste, and are put into Venice treacle, as a substitute for the real *Amomum*.

---

" The more we extend our researches into the vegetable kingdom, the more will every susceptible mind be excited to proceed. We shall find the most delicate and elaborate processes in ceaseless progression on the mountains and in the valleys—the meadows and the recesses of our woods, all subject to immutable laws. We shall find colours unrivalled, odours inimitable, and forms exhaustless in variety and grace, daily developed in the grand laboratory of Nature, demanding only to be seen to extort our unqualified admiration, and leading us irresistibly to contemplate the glory of that Almighty Being from whom so many wonders emanate ; and

" Who, not content

With every food of life to nourish man,  
Hath made all nature beauty to his eye  
And music to his ear. "

DR. GREVILLE.

*Ammophila arundinacea. Common Sea-reed. 2*

\* From *ammos*, Gr. sand; and *philos*, Gr. a lover.

† See folio 56, n. t.

## Perennial.—Flowers in June and July.

*Root* jointed, extensively creeping, often extending to a great many feet. *Plant* glaucous. *Culms* ascending, 2 or 3 feet high, cylindrical, jointed, finely striated, very smooth, almost solid. *Leaves* very long, narrow, rigid, sharp-pointed, their margins rolled in so as to give them the appearance of rush-leaves; furrowed, whitish, and pubescent above (see fig. 5.) ; dark-green, and smooth beneath. *Sheaths* lightish-brown, striated, nearly or quite smooth. *Stipula* (*ligula*) membranous, spear-shaped, pointed, nearly an inch long, mostly divided, or torn. *Panicle* upright, quite close, cylindrical, tapering a little at each end, straw-coloured, many-flowered, and so perfectly resembling a spike, that, without inspection, it might be mistaken for one; its branches short, upright, not much divided, close-pressed, angular, and rough. *Glumes* (see figs. 1 & 2.) nearly equal, spear-shaped, compressed, with a rough keel; the inner one rather the largest, with a rib at each side; outer one with a minute point below the summit. *Paleæ* (see figs. 1 & 3.) compressed, roughish, dull, of the same texture as the glumes, but rather smaller, and more ribbed, the outer one bearing a small, short, dorsal *awn*, below the top. *Hairs* (see fig. 3.) chiefly attached to the inner palea, and scarcely half its length. *Nectary* (see fig. 4.) longer than the germen. *Styles* (see fig. 4.) distinct, upright. *Stigmas* long, cylindrical, feathery. *Seed* oblong, pointed at the upper end.

This grass grows only on the driest sea-shores, where it is of the greatest utility, particularly when combined with the *Elymus arenarius*, in binding the sands of the sea-shore, and thereby raising a natural barrier the most lasting against the encroachments of the ocean upon the land; and also in preventing the wind from dispersing the sand over the adjoining fields, which is not unfrequently the case where this plant is wanting. Many a fertile acre has been covered with sand and rendered useless, which might have been prevented by sowing the seeds, or by planting small bundles of this plant at distances of about a foot and a half apart; a method introduced by Mr. MACLEOD, of Harris, in the Hebrides of Scotland, and tried extensively on his estate. For some interesting illustrations of its utility in this respect, see CUVIER'S *Essay on the Theory of the Earth*, (5th edit.) p. 28, and pp. 368—375. Mr. WOODWARD says, it is planted on some of the flat coasts of Norfolk to repel the sea, and is also suitable to the light lands of that county. He observes, that as soon as it takes root a sand-hill gathers round it, and thinks that some of our sandy cliffs may have thus originated. It is also supposed that this plant, together with a few others which seem designed by nature to bind the loose sands of the sea-shore by their creeping roots, or stolones, aie the means of forming the low round-topped hills, called Links, along a considerable part of our northern coasts. Mr. SINCLAIR observes, so far back as the reign of William the Third, the important value of this grass, and *Elymus arenarius*, was so well appreciated as to induce the Scottish Parliament of that period to pass an act for their preservation on the sea-coasts of Scotland. And these provisions were, by the British Parliament, in the reign of George the Second, followed up by further enactments, extending the operation of the Scottish law to the coasts of England, and imposing further penalties for its inviolability; so that if was rendered penal, not only for any individual (without even excepting the lord of the manor) to cut the bent, but for any one to be in possession of any within eight miles of the coast. The inhabitants of Newborough, in Anglesey, subsist chiefly by manufacturing this Reed into mats and ropes. It also makes excellent floor-brushes. In the outer Hebrides it is made into ropes for various uses, mats for pack-saddles, bags, mats, and vessels for preparing and keeping grain and meal; and, lastly, into hats.

\* From *gumnos*, Gr. *naked*; and *adno*, Gr. a *gland*; one of the essential characters of this genus.

† See fol. 8, note †.      § See fol. 387, a.      ‡ See fol. 33, note ‡.

a figure.—Ray's *Syn.* p. 381.—*P. caryophyllata*, Bauh. *Hist.* v. ii. p. 777, with a figure.—*Serapias minor, nitente flore*. Johnson's *Gerarde*, p. 222.; *S. gario-phyllata*, *ibid.* p. 223.

**LOCALITIES.**—In rather moist meadows and pastures, and in heathy bogs.—More or less frequent in most counties of ENGLAND, WALES, and IRELAND.—Most abundant in SCOTLAND, where, Sir W. J. HOOKER says, it scents the atmosphere with its fragrance.

**Perennial.**—Flowers from June to August.

*Root* distinctly palmate, with several long slender divisions. *Stem* from 12 to 18 inches high, upright, cylindrical below, somewhat angular upwards, smooth, leafy, hollow. *Leaves* strap-spear-shaped, keeled, pointed, bright green; *lower ones* embracing the stem; *upper ones* sessile, decreasing in size upwards. *Spike* cylindrical, 3 inches or more long, variable in density, but usually loose, many-flowered. *Bracteas* spear-shaped, pointed, rather longer than the germen. *Flowers* of a uniform crimson or pale purple in every part, without spots, very fragrant. The upper sepal (fig. 1, a.) and the 2 petals (fig. 1, b, b.) closely approaching, their points bent inwards, and covering the *style* and *anthers*. Two lateral sepals (fig. 1, a, a.) spreading, their margins revolute. *Lip* or *Nectary* (fig. 1, c.) minutely downy, in 3 uniform, equal, entire, rather deep, flat lobes. *Spur* (see figs 1 & 2.) very slender, twice as long as the germen, pointing downwards, curved, cylindrical, pointed. The two *cells* of the *anthers* (fig. 3.) are perforated at the base, through which the naked, large, and oblong *glands* of the *stalks* of the *pollen-masses* appear.

The great length of the slender curved spur of this species will readily distinguish it from most other British Orchideæ. It sometimes occurs with a white flower; and the Rev. G. E. SMITH, in his very interesting account of the Plants of South Kent, mentions a variety with spotted purple flowers having been found at the Cherry Garden, near Folkestone, Kent; and a singular variety without the spur, or rather with a short mucro instead, was found by Mr. W. PAMPLIN, jun., on Juniper-hill, near Dorking, in 1833.

*Gymnadenia conopsea* is an elegant and rather showy plant, and is highly deserving a place in the flower garden. It likes a somewhat moist and shady situation, but, like most other Orchideæ, it is not of very easy culture. Those who wish for information on the subject of cultivating this curious tribe of plants, will do well to consult Mr. LINDLEY'S *Gardener's Magazine*, vol. i. p. 464—466.; vol. ii. p. 285.; and vol. vii. p. 306.

The British genera of ORCHIDEÆ are thus arranged by Professor LINDLEY.

**Section I.** Pollen simple, or consisting of granules in a lax state of cohesion.  
Tribe 1. NEOTTIEÆ. Anther parallel with the stigma, and erect.—1. *Goodyera*, t. 309.—2. *Spiranthes*, t. 63.—3. *Listera*, t. 357.

Tribe 2. ARETHUSEÆ. Anther terminal, like a lid.—4. *Corallorrhiza*.—5. *Epipactis*, t. 317.

**Section II.** Pollen cohering in grains or masses, which are indefinite in number, and waxy.

Tribe 3. OPHRYDEÆ.—6. *Orchis*, t. 213.—7. *Gymnadenia*, t. 409.—8. *Platanthera*.—9. *Peristylus*, t. 387.—10. *Aceras*, t. 305.—11. *Ophrys*, t. 8.—12. *Herminium*, t. 295.

**Section III.** Pollen cohering in grains or masses, which are definite in number, and waxy.

Tribe 4. MALAXIDEÆ.—13. *Malaxis*, t. 394.—14. *Liparis*.

**Section IV.** Lateral anthers fertile, intermediate sterile and petaloid.

Tribe 5. CYPRIPEDIEÆ.—15. *Cypripedium*, t. 105.

Brit. Bot. p. 138.

LOCALITIES.—In waste ground, pastures, and on banks by road-sides.

### Biennial.—Flowers from June to September.

*Root* branching, fibrous. *Stem* 3 or 4 feet high, upright, stout, solid, branched, angular, furrowed, leafy, hairy or downy, many-flowered, with strong, spiny wings. *Leaves* alternate, sessile and decurrent at the base, long, spear-shaped, spreading; hairy and deep green above, downy and somewhat glaucous underneath; deeply pinnatifid, their lobes spreading alternately, somewhat palmate, armed with stout yellowish spines. *Flowers* large, purple, generally solitary at the summits of the stem and branches. *Involucrum* egg-shaped, its scales spear-shaped, dark green, smooth, strongly keeled, terminating in a rigid, narrow, spreading spine; margins fringed about the middle with cottony down, which gives the involucrum a cobweb-like appearance (see fig. 2); points of the inner scales upright and more appressed. *Plorets* (see fig. 3.) tubular, tube twice the length of the limb, white, very slender; limb purple, dilated, deeply cut into 5, strap-shaped, concave segments, which are thickened and blunt at the apex. *Filaments* free, pubescent; *anthers* bristly at the base. *Seed* inversely egg-shaped, purplish, smooth and polished, obsoletely 4-angled, crowned with a raised margin and conical obtuse appendage. *Pappus* (see figs. 5 and 6.) sessile, feathery. *Receptacle* with long hairs.

Dr. WITHERING observes, that "few plants are more disregarded than this, and yet its use is very considerable. If a heap of clay be thrown up, nothing would grow upon it for several years, did not the seeds of this plant, wafted by the wind, fix and vegetate thereon. Under the shelter of this, other vegetables appear, and the whole soon becomes fertile. The flowers, like those of the Artichoke, have the property of curdling milk. Sheep and swine refuse this plant; and neither horses, cows, nor goats, are fond of it."—The *Papilio Cardui*, and the *Thistle Ermine Moth*, are said to feed upon it. The seeds are the favourite food of many small birds,

It is a large and succulent plant, and is often too well known on strong lands.

Professor MARTYN tells us, that he has seen the air perfectly filled with the seed-down of the *Spear-thistle*, for miles together, on a windy day, flying along, till it was intercepted by a hedge, bank, or rising ground. Where it is seen in such abundance, the greater part of it is generally down without seed; but for this the farmer is obliged to the goldfinch and other small birds; they, however, usually leave enough to stock his grounds with this cumbrous and unwelcome weed, but as it is only biennial, it is readily destroyed by mowing it down before its flowers form seed.

For some account of the beautiful contrivance of Nature for disseminating the seeds of this tribe of plants, see the second page of fols. 163 & 177 of this work.

卷之三

*Pimpinella Saxifraga. Burnet Saxifrage.* 21

Mathews, Ed. & Sc.

Pubd by W. Burt's Botanic Garden, Oxford, 1861.

## PIMPINELLA \*.

*Linnean Class and Order.* PENTA'NDRIA †, DIGY'NIA.

*Natural Order.* UMBELLIFERÆ †, Juss. Gen. Pl. p. 218.—Sm. Gram. of Bot. p. 132.—Lindl. Syn. p. 111; Introd. to Nat. Syst. of Bot. p. 4.—Rich. by Macgilliv. p. 463.—Loud. Hort. Brit. p. 517.—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 235.—Mack. Fl. Hibern. p. 113.—Hook. Brit. Fl. (4th ed.) p. 408.—UMBELLATÆ, Linn.—ROSALES; sect. ANGELICINÆ; type, ANGELICACEÆ; subty. ANGELICIDÆ; Burn. Outl. of Bot. v. ii. pp. 614, 770, 773, & 774.

**GEN. CHAR.** *Flowers* (see fig. 1.) all regular and perfect. *Calyx* an obsolete margin. *Corolla* (fig. 1.) of 5, equal, or nearly equal, inversely egg-shaped, emarginate, inflexed petals. *Filaments* (see fig. 1.) hair-like, spreading, longer than the corolla. *Anthers* roundish. *Germen* (see fig. 2.) inferior, egg-shaped, a little compressed, smooth, finely ribbed. *Styles* (see figs. 1 & 2.) 2, hair-like, somewhat spreading, short in the flower, afterwards as long as the fruit, or longer, tumid, and nearly globular, at the base. *Stigmas* blunt, somewhat capitate. *Floral Receptacle* none. *Fruit* contracted at the side, egg-shaped, crowned with the swollen base of the reflexed styles. *Carpels* (see fig. 3.) with 5, equal, slender ridges, of which the two lateral ones form a margin. *Interstices (channels)* furrowed, with many *vittæ*. *Seeds* convex, flattish in the front. *Involucrum* none. *Flowers* white.

The obsolete *calyx*; the inversely egg-shaped, inflexed *petals*; the egg-shaped *fruit*, crowned with the swollen base of the reflexed *styles*; and the *carpels* with 5 slender, equal ridges, with many *vittæ* in each channel; will distinguish this from other genera, without an involucrum, in the same class and order.

Two species British.

PIMPINELLA SAXI'FRAGA. Common Burnet-Saxifrage. Saxifrage Anise.

**SPEC. CHAR.** Stems slightly striated, pubescent. Leaves pinnate; leaflets of the root-leaves roundish; those of the stem in various strap-shaped segments. Styles shorter than the germen. Fruit egg-shaped.

LOCALITIES.—In dry pastures, on banks, and on rocks, in a sandy, gravelly, or chalky soil; not uncommon.

Perennial.—Flowers in July and August.

*Root* spindle-shaped, tough and woody, highly aromatic and pungent, not unpleasant, especially when dry. *Stems* from 1 to 2 feet high, upright, solid, cylindrical, striated, downy, leafy, varying much in luxuriance, usually branched above. *Leaves* on longish petioles, oblong, pinnate, veiny, roughish and rigid; *leaflets* of the root-leaves roundish egg-shaped, deeply serrated and cut; those of the upper leaves, and sometimes of all, simply or doubly pinnatifid, with acute, spreading, decurrent segments (see fig. 4). *Umbels* terminal, flattish, of many *general* and *partial* smooth rays, drooping when young, without any *involucrum*. *Flowers* white, small, nearly equal. *Stamens* long. *Styles* not quite so long as the *germen*, their tumid bases reddish. *Fruit* small, egg-shaped, ribbed.

This species is a native throughout the whole of Europe, Tauria, Caucasus, and Persia. The great diversity in its size, and also in the form and divisions of its foliage, has occasioned some authors to make several species of it. The principal varieties found with us are the following:—

a. *Poteriifolia*. Root-leaves pinnate; leaflets egg-shaped, roundish at the base, entire, deeply serrated or cut. See the accompanying plate.

b. *Intermedia*. Root-leaves pinnate; leaflets egg-shaped, deeply and pinnatifidly cut, lobes egg-shaped, deeply serrated.

γ. *Dissecta*. Root-leaves pinnate; leaflets egg-shaped, bipinnatifid, segments intire (fig. 4). P. δ. *Dissecta*. Sibth. Fl. Oxon p. 102. Abbot's Fl. Bedf. p. 68.—Gray's Nat. Arr. v. ii. p. 512.—Lindl. Fl. Med. p. 38.

Dr. WITHERING remarks, that these varieties are occasioned by the different age of the plant, and the greater or lesser expansion of its foliage according to the soil in which it grows. He suggests, it is probable that the first root-leaves are the same in all, that is, simply winged, the leaflets egg-shaped and serrated; that when these disappear, the lower leaves have wing-cleft, or doubly winged leaves, and the upper leaves become also more compound with the rest. All these varieties may occasionally be found growing together in the same locality.

The root, which is very acid and astringent, is used as a masticatory to relieve the toothache, and in decoction to remove freckles. It affords a blue essential oil, and communicates that colour to water or spirit on distillation. A species of coccus, from which colouring matter may be procured, infests the roots. The *Papilio Machaon*, or Swallow-tailed Butterfly, one of the largest and most superb of all the British Lepidoptera, is sometimes found on this plant, on which, and on some other of the umbelliferæ, the caterpillar feeds.

*Polamagrostis Epigejos. Wood Small-reed 71*

*Nathanael D. S.*

*Printed by W. H. Fox, in Bloomsbury Garden, Oxford, 1861.*

## CALAMAGRO'STIS\*.

*Linnean Class and Order.* TRIA'NDRIA †, DIGY'NIA.

*Natural Order.* GRAMI'NEÆ, Juss. Gen. Pl. p. 28.—Sm. Gram of Bot. p. 86. ; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293. ; Introd to Nat. Syst. of Bot. p. 292.—Rich. by Macgilliv. p. 393.—Loud. Hort. \* From *kalamos*, Gr. one of the *Palms*; and *agrostis*, Gr. a genus of grasses; a barbarous denomination, and only admissible on the ground of its being now generally adopted. Sir W. J. HOOKER.

† See fol. 56, note †.

**LOCALITIES.**—In shady ditches, moist woods, and in hedges.—*Oxfordshire*; Magdalen College Copse; Tar Wood; in a furze field between Bullington-green and Shotover-hill. Copse near Horsepath, by the foot-path.—*Berks*; On the banks of ditches on the north side of Bagley Wood, nearly opposite to South Hinksey; 1827.—*Beds.* Sheerhatch Wood.—*Cambridgesh.* Madingley, Kingston, and Eversden Woods; Comberton; Wood Ditton; Isle of Ely; Plantations by Fulbourn Moor; Teversham Moor; Hill near Linton, by the back road from Hildersham.—*Cumberland*; Dunmallet, by the front avenue, rare.—*Dorset*; Wet ditches about Weymouth, and in Purbeck; in several places in the Vale of Blackmoor.—*Durham*; At the foot of the N. branch of Castle Eden Dean, and by the Tyne above Hebburn Quay.—*Essex*; Epping Forest; near Salter's Buildings, Walthamstow; borders of the wood called the Larks, near Chingford.—*Kent*; In the wood, west of the Cherry Garden. In a wood near the High Rocks, towards the Wells.—*Leicestersh.* Martinshaw Wood, near Grooby; Cloud Wood; abundant in the Park at Bosworth; also in Sutton Am-bien Wood, the site of Bosworth Field.—*Lincolnsb.* Moist woods, not unfrequent; near Gainsborough, in every ditch.—*Middlesex*; Between Hornsey and Newington; in the old Park Wood at Harefield, and in the lane leading from Harefield to Rickmansworth, plentifully.—*Norfolk*; In Hethel and Ar-mingham Woods, near Norwich; Earsham Wood.—*Northumberland*; On the banks of N. Tyne near Warden Mill; in woods near Gilsland Wells; and in a moss near the Routing Linn, in the vicinity of Doddington.—*Notts.* Between Bulwell and Nuthall.—*Shropsh.* Side of a ditch on the borders of Aqualate Mere; and near Battlefield Church.—*Somersetsh.* In a hedge by the road-side between the Monument and Tracy Park.—*Suffolk*; Bungay.—*Sussex*; Wet thickets, rather rare.—*Warwicksh.* Dunnington; Salford; and Wetheley; in woods near Alcester; and near Allesley.—*Worcestersh.* East side of Perry Wood.—*Yorksh.* Leeds; Copgrove; in woods at Castle Howard, but very rare; in a little wood at Fawdington, near Helperby; Boroughbridge; ditch near Monckton common field by Ripon; common near Thirsk.—**WALES.** *Anglesey*; Above the beach between Friars and Lleinio; Lligwy Wood, &c.—**SCOTLAND.** *Aberdeensh.* In Braemar, several miles below Invercauld, on the south side of the river, among wood; and on a steep bank on the north side of the Dee, a little below Manse of Drumoak.—*Argylesh.* Mac Lean of Coll's Woods, near Tobermory.—*Ayrsh.* Dalrymple Wood, Ayr.—**IRELAND.** *County of Derry*; Formoyle-hill, parish of Dunboe.

**Perennial.**—Flowers in July.

*Root* creeping. *Culm (stem)* from 3 to 5 feet high, upright, cylindrical, jointed, hollow, striated, furrows slightly pubescent. *Leaves* strap-spear-shaped, with a sharp, taper point, roughish, a little glaucous underneath. *Sheaths* very large, clasping, striated, scarcely rough, except the upper one. *Stipula (ligula)* spear-shaped, pointed, thin, soon torn. *Panicle* from 6 to 11 inches long, upright, purplish, its branches rough; spreading when in flower, close afterwards. *Flowers* (fig. 1.) numerous, directed to one side. *Glumes* (fig. 2.) nearly equal, long and narrow, purplish, rough at the keel. *Outer Palea* (see fig. 3.) about half as long as the glumes, membranous, flat, with 2 rough marginal ribs at each side, bifid and rough at the point, with a dorsal awn about as long as the glumes; *inner palea* much smaller, slightly bifid and rough. *Hairs* (see figs. 1 & 3.) as long as the glumes.

A handsome Grass, but of little or no interest to the Agriculturist.

## STRATIO'TES\*.

*Linnean Class and Order. POLYA'NDRIA, HEXAGY'NIA.*

*Natural Order. HYDROCHARI'DEÆ, Dec. Fl. Fr. v. iii. p. 265.—Lindl. Syn. p. 254.; Introd. to Nat. Syst. of Bot. p. 254.—Rich. by Macgilliv. p. 414.—Loud. Hort. Brit. p. 536.—Mack. Fl. Hibern. p. 272.—Hook. Brit. Fl. (4th ed.) p. 425.—HYDROCHARIDES, Juss. Gen. Pl. p. 67.—Sm. Gram. of Bot. p. 84.—MUSALES; sect. HYDROCHARINÆ; type, STRATIO'TACEÆ; Burn. Outl. of Bot. v. i. pp. 437, 464, & 465.—PALMÆ, Linn.*

**GEN. CHAR.** *Spatha* compressed, of 2 leaves; 1-flowered, permanent. *Calyx* (see fig. 1.) superior, tubular, upright, of 1 sepal, in 3 deep, deciduous segments. *Corolla* (see fig. 2.) of 3, inversely egg-shaped, concave, slightly spreading petals, which are alternate with the segments of the calyx, and twice as long. *Filaments* (see fig. 3.) about 20, inserted into the apex of the tube of the calyx, and shorter than its segments. *Anthers* vertical, awl-shaped. *Germen* (see fig. 1.) inferior, elliptical, bluntly triangular. *Styles* (see fig. 3.) 6, deeply cloven, as long as the stamens. *Stigmas* simple. *Fruit* (see figs. 4 & 5.) inferior, fleshy, taper-pointed, 6-cornered, 6-celled, and many-seeded. *Seeds* (see figs. 5 to 8.) numerous, inversely egg-shaped, attached to the dissepiments.

The 2-leaved *spatha*; the 3-cleft *calyx*; the *corolla* of 3 petals; and the inferior, angular, 6-celled, many-seeded, fleshy *fruit*; will distinguish this from other genera in the same class and order.

One species British.

**STRATIO'TES ALOI'DES.** Aloe-like Water-soldier. Fresh-water Soldier. Water Aloe. Water Sengreen.

**SPEC. CHAR.** Leaves sword-shaped, channelled, with a prominent rib, and sharp marginal prickles.

Engl. Bot. t. 379.—Fl. Dan. t. 337.—Linn. Sp. Pl. p. 754.—Huds. Fl. Angl. (2nd ed.) p. 236.—Willd. Sp. Pl. v. iv. pt. II. p. 820.—Sm. Fl. Brit. v. ii. p. 579.; Engl. Fl. v. iii. p. 34.—With. \* From *stratos*, Gr. an army; on account of its numerous sword-like leaves.

† See folio 51, note †.

years ago, that Mr. BICHENO had observed it in the same neighbourhood.—*Cambridgesh.* Near the bridge at Ely; Stretham Ferry; Rampion; Audrey Causeway; Mepole; beyond Littleport; March; &c.: Rev. R. RELHAN.—*Cheshire*; In ponds about four miles from Holme's Chapel: Mr. HUNTER. In several ponds near Gorton, four miles from Stockport: Mr. G. HOLME.—*Lincolnshire*; In the fen ditches, and those in the marsh behind the sea bank, where the water is deep and the current slow: Sir JOSEPH BANKS. Near the new bridge at Gainsborough: Sir T. G. CULLUM.—*Norfolk*; About Bungay, and various other places in Norfolk: Mr. WOODWARD. Near Lynn: Mr. E. FOSTER, jun. Ditches by the side of Acle Dam, plentifully: Mr. WIGG. Ditch on the side of Haddisco Dam, by the Turnpike Gate; and in vast abundance on Hoveton Common: D. TURNER, Esq. Lynn Regis; 1826: G. HOWITT, in N. B. G. Abundant in the peat-holes, Royden Fen: Rev. A. BLOXAM.—*Northamptonsh.* In the fen ditches: MORTON.—*Northumberland*; Naturalized in the ponds at Wallington and north of Cambo; ponds at Nether Witton; brought from the S. of England: N. J. WINCH, Esq.—*Notts*; Clay-pits, in Stoke Park, near Newton, (Ordryno); in the moat at Strelley: Dr. HOWITT, in N. B. G.—*Shropsh.* Lilleshall Pond: Miss MC. GHIE.—*Suffolk*: Lowdham Hall Mere: CRABBE. Ditches near Bungay and Worlingham: Mr. WOODWARD. At Bradwell and elsewhere about Yarmouth; on Haddisco Dam, close by the turnpike Gate: Mr. WIGG.—*Surrey*; In the pond opposite the Three Houses, Wandsworth Common; and in the wide brook at the foot of Lavender Hill. It was first introduced to this neighbourhood by Mr. W. ANDERSON, of the Chelsea Garden, and has now become completely naturalized: Mr. W. PAMPLIN, jun.—*Yorksh.* Near Beverley: COLONEL MACHELL. In the Gyne near Thorn: Mr. ROBSON.—*SCOTLAND*. Edinburghsh. Duddingston Loch: Mr. H. C. WATSON, in N. B. G.—*Forfarsh.* Foifar Loch, introduced by Mr. DON.—*Perthsh.* Loch of Clunie: Rev. Mr. MC. RITCHIE. Blair Athol, (Boué): N. J. WINCH, Esq.—*IRELAND*. Near Crum-castle and Castle Saunderson on the banks of Loch Erne; also on the banks of the Shannon, near Portumna; Belfast Water-course: Mr. TEMPLETON.

#### Perennial.—Flowers in July.

*Root fibrous. Stem none. Leaves all radical, triangular, sword-shaped, from 6 to 9 inches long, sharply toothed at the margin; forming star-like tufts, as in the Aloes. Scape (flower-stalk) solitary, firm, stout, two-edged, shorter than the leaves, single-flowered. Flowers white, large and handsome, from a compressed 2-leaved spathe. Stamens short; anthers awl-shaped, with rough globose pollen. Fruit somewhat egg-shaped, beaked, drooping, fleshy; cells with a double membrane, very thin, separating lengthwise, full of crystalline pulp. Seeds from 10 to 12 in each cell, egg-shaped, somewhat angular, of a pale, brownish red, nestling in the pulp, and fastened to the rind of the fruit, near the external angles of the cells. GERTNER says, the pulp in its natural state is clear, like the vitreous humour of the eye; in spirits of wine it becomes opaque and white, like the white of an egg when boiled; plunged into water it becomes clear again.*

This singular plant, which is a native of Siberia as well as of Europe, is a stoloniferous aquatic, and remains submerged during the Autumn and Winter months; but, as Spring advances, it puts forth, from amongst its leaves, numerous thick runners, each of which bears at its extremity a *gemma*, or young plant, which rises to the surface of the water, where it grows to maturity, and where it floats till after its season of flowering, when it sinks to the bottom of the water, and becomes, in its turn, the parent of another race of young offsets; in this manner it frequently so entirely fills up ditches and ponds as to exclude all other herbage. The *anthers* are occasionally imperfect in one flower, the *stigmas* in another, whence some have thought the flowers dioecious, but Sir J. E. SMITH observes, that such casual imperfection in those parts is frequent in plants that increase much by root. A great variety of insects are nourished by this plant; some of them pursue it down to the bottom of the water, and devour the leaves. Swine eat it, goats refuse it.

*Liparis loeselii* Two-leaved Liparis. II

Mathew, Del. & Sc.

Publ'd by W. H. Allen: Garden Oxford 1861.

## LI'PARIS \*.

Fig. 1. A separate Flower; *a, a, a*. sepals; *b, b*. petals; *c.* lip; *d.* column; *e.* anther; *f.* germen; *g.* bractea.—Fig. 2. Front view of a Flower.—Fig. 3. Front view of a column of an expanded Flower.—Fig. 4. The same column with the anther turned back, showing the stigmatic cavity and pollen-masses.—Fig. 5. View of the face of the anther without its pollen.—Fig. 6. A Capsule.—All, except fig. 6. magnified.—The dissections, with the exception of fig. 6, are all copied, and reduced, from Professor LINDLEY's beautiful work, entitled, "Illustrations of Orchidaceous Plants."—The plates from drawings, by the late Mr. FRANCIS BAUER.

\* From *liparos*, Gr. *fat*; or unctuous to the touch.

† See folio 8, note †.      § See folio 33, note †.      § See folio 309.

**LOCALITIES.**—On sandy bogs, among rushes; very rare.—*Cambridgeshire*: Teversham; Fulbourn; and Sawston Moors: Rev. R. RELHAN. Hinton Moor: Dr. WITHERING. Burwell Fen: C. C. BABINGTON, Esq. in N. B. G.—*Kent*: Boggy ground about Ham Ponds, near Eastry: L. W. DILLWYN, Esq.—*Norfolk*: St. Faith's Newton Bogs, near Norwich: Mr. PITCHFORD. Roydon Fen, near Diss: Mr. WOODWARD.—*Suffolk*: Bogs near Tuddenham: Sir T. G. CULLUM.

**Perennial.**—Flowers in July.

Root somewhat bulbous, bulb solid, greenish, covered with soft pale scales, increasing by one or more lateral offsets from the base, and sending down, from the same part, many simple, wavy radicles. Leaves 2, of equal size, spear-shaped, strap-spear-shaped, or sometimes inversely egg-shaped, quite entire, smooth, bright green, with one central rib and many small ones; their bases elongated and sheathing. Scape (*stalk*) from between the leaves, from 3 to 8 inches high, triangular, smooth, naked. Flowers from 3 or 4 to 8, seldom more, in a kind of raceme, each with a small spear-shaped bractea at its base (see fig. 1. g). Sepals (see fig. 1. a, a, a.) spreading, spear-shaped, bluish, of a pale lemon-colour. Petals (fig. 1. b, b.) strap-shaped, rather longer and narrower than the sepals, likewise spreading, and of nearly the same hue. Lip (*nectary*) (fig. 1. c.) of a deeper yellow, rather longer than the petals, inversely egg-shaped, folded, or channelled, wavy, or slightly crenate. Germen (fig. 1. f.) inversely egg-shaped. Capsule (fig. 6.) upright, elliptic-oblong, angular, many-seeded. Seeds numerous, very small.

As well as of England, this curious plant is also a native of Denmark, Sweden, and Prussia. It is one of the very rarest of our native *Orchideæ*, having never been found either in Wales, Scotland, or Ireland; and even in England, according to WITHERING, the Norfolk and Suffolk stations given for it, are very doubtful.

The drawing for the accompanying plate was made from a specimen preserved in the *Sherardian Herbarium*, but whether of British or Foreign growth, is not specified. Sir W. J. HOOKER observes, that the flowers of this species are, in their general structure, very similar to those of the tropical and parasitical *Liparis foliosa*, figured in the *Botanical Magazine*, t. 2709.

#### THE WILD FLOWER.

“ Sweet wilding tufts that 'mid the waste  
Your lovely buds expand;  
Though by no sheltering walls embraced,  
Nor trained by beauty's hand;

The primal flowers which grace your stems  
Bright as the dahlia's shine,  
Found thus, like unexpected gems,  
To lonely hearts like mine.

'Tis a quaint thought, and yet perchance,  
Sweet blossoms ye are sprung  
From flowers that over Eden once  
Their pristine fragrance flung;

That drank the dews of Paradise,  
Beneath the starlight clear;  
Or caught from Eve's dejected eyes  
Her first repentant tear.”

of Oxf. p. 78.—Irv. Lond. Fl. p. 195.—Mack. Catal. Pl. of Irele. p. 28.—Fl. Hibern. p. 121.—*Sium umbellatum repens*, Johns. Gerarde, pp. 256 & 258, n. 3.; excluding the reference to Delech. Hist. Lugd. 1092.—Ray's Syn. p. 211.

LOCALITIES.—In ditches and rivulets; frequent.

Perennial.—Flowers in July and August.

*Root* creeping. *Stems* procumbent, or floating, occasionally creeping, various in length, rooting at the joints, stout, angular, furrowed, smooth, leafy, hollow; with numerous widely spreading branches. *Leaves* alternate, distant, pinnate, smooth, each of from 2 to 4 pair of sessile, egg-shaped leaflets, with an odd one, all equally serrated; the terminal one largest, and sometimes confluent with the next pair below it. *Petioles* (leaf-stalks) dilated at the base with a broad membranous border. *Umbels* opposite to the leaves, often nearly sessile, but generally on peduncles varying in length, but never equalling the umbels. *Involucrums* dilated and membranous at the edges; *general one* of a single leaf, or mostly wanting; *partial one* of several, egg-shaped, pointed, concave leaves, white with green ribs. *Flowers* small. *Calyx* very short. *Petals* white, egg-shaped, entire, slightly inflexed. *Styles* somewhat incurved. *Fruit* roundish egg-shaped, short, smooth, with 3 dorsal, prominent ribs, and 2 remote lateral ones, to each *carpel* (see fig. 3).

The juice of this plant is recommended in cutaneous disorders. Three large spoonfuls are given, mixed with milk, twice a day.

SMITH.—The leaves greatly resemble those of the true Water-cress, (t. 271.) for which they have been sometimes mistaken, but they may readily be distinguished by the dilated sheathing base of the leaf-stalk, which is not sheathing in the Water-cress.

The Green Polype, *Hydra viridis* of LINNÆUS, figured in Shaw's Naturalist's Miscellany, v. i. t. 20., is often to be found on the stems and leaves of this plant, under water. This extraordinary little aquatic animal was first shown to me, many years ago, by the late Mr. JAMES BENWELL\*.

\* MR. JAMES BENWELL was, for more than forty years, employed in the Oxford Botanic Garden. He was, although uneducated, a very intelligent man, and his accurate knowledge of British Plants, and of their localities in the vicinity of Oxford, and a singular talent for observation in every branch of Natural History, rendered his services highly valuable. He attended the late Dr. JOHN SIBTHORP, Professor of Botany, in his botanical excursions in Oxfordshire, when collecting materials for his "Flora Oxoniensis," published in 1794, and was the first who discovered the station for *Paris quadrifolia*, and one or two other rare plants, in the county. His integrity, and industry, and a natural propriety, and civility of manners, gained him the respect and esteem of all who knew him. He died on the 7th of October, 1819, aged 84 years. A print of him, a very striking and characteristic likeness, engraved by Mr. SKELTON, of Oxford, from a drawing by that excellent artist, Mr. A. R. BUNT, was published about two years before his death. I shall always remember, with the most sincere gratitude and respect, the kind and disinterested assistance I received from this honest and kind-hearted man; and from another highly valued and lamented friend, the late Mr. JOHN MADDOX, when I first turned my attention to the study of British Botany. Mr. MADDOX was, for many years, gardener at Christ Church; he was an excellent practical gardener, a great advocate for the LINNÆAN System of Botany, and a remarkably well informed man; he possessed, indeed, such a general knowledge of the natural sciences as is rarely to be met with amongst men in his station of life. He died on the 8th of April, 1828, in the 80th year of his age. It is remarkable, that himself and his wife died within a day or two of each other, and were both buried on the same day, in one grave, in the church-yard of St. Aldate's, Oxford.—W. B. February 27, 1841.

Hibern. p. 300.—*Gramen paniculatum minimum molle*, Scheuchz. Agrost. p. 215. t. 4. f. 15.—*Gramen paniculatum locustis parvis purpuro-argenties annum*, Ray's Syn. p. 407.

**LOCALITIES.**—On heaths, hillocks, in pastures, and fallow fields, on a barren sandy soil; frequent.

Fig. 1. A Spikelet.—Fig. 2. A separate Floret.—Fig. 3. Germen, Styles, and Stigmas.—Fig. 4. A Seed.—Figs. 1, 2, & 3, magnified.

\* From *airo*, Gr. to destroy. This name was anciently applied to the *Lolium temulentum* (bearded Darnel,) on account of its injurious effects; and now to the present genus of grasses, though having little in common with it. Sir W. J. Hooker.

† See folio 56, note †.

Annual.—Flowers from May to July.

*Root* small, fibrous. *Culms (stems)* slender, upright, from 2 to 6 inches or a foot high, cylindrical, jointed, smooth, leafy. *Leaves* few, slender, strap-shaped, short; those near the root soon withering; *sheaths* smooth, purplish, ribbed and striated. *Stipula (ligula)* large, spear-shaped, pointed, bifid. *Panicle* spreading, trichotomous, few-flowered; branches hair-like, angular, compressed, channelled, nearly smooth, slightly wavy. *Spikelets* (see fig. 1.) small, egg-shaped, silvery, often purplish-grey. *Glumes* (see fig. 1.) nearly equal, egg-spear-shaped, irregularly notched, rough at the keel and near the pellucid point, margins finely serrated. *Paleæ* (see fig. 2.) unequal, shorter than the glumes, the *outer* one largest, spear-shaped, rough, bristly near the point and edges, bifid, with a rough, twisted, slightly bent *awn*, proceeding from below its middle, longer than the glumes; *inner palea* bifid, with 2 smooth marginal ribs and incurved edges.

This elegant little grass is of no value to the farmer, as it furnishes but little herbage, and soon withers away; and unless it be sought for about the season of its flowering, it will not easily be discovered. The species most likely to be confounded with this by the young Botanist, is *Aira præcox*, but that is sufficiently marked by its very small size, spike-like panicle, and the inflated angular sheaths of its leaves. The white-pointed glumes, and smaller spikelets, of *Aira caryophyllea*, will distinguish it from *Aira flexuosa*, another nearly allied species.

---

#### W E E D S.

“ Scorn not those rude, unlovely things,  
All cultureless that grow,  
And rank, o'er woods, and wilds, and springs,  
Their vain luxuriance throw.

Eternal love and wisdom drew  
The plan of earth and skies,  
And HE, the span of heaven that threw,  
Commands the weeds to rise.

Then think not nature's scheme sublime  
These common things might spare :—  
For science may detect in time  
A thousand virtues there.”

‡ See fol. 27, a.

**LOCALITIES.**—About the borders of fields, in waste places, and by road-sides, chiefly on a gravelly or chalky soil.

**Perennial.**—Flowers in July and August.

*Root* spindle-shaped, fleshy, often more or less branched, of a yellowish colour externally, whitish within, milky. *Stem* from 1 to 3 feet high, upright, angular, furrowed, alternately branched, very tough, solid, rough with bristly hairs, leafy. *Root-leaves* numerous, spreading, above a span long, runcinate, toothed, rough, on dilated petioles; *stem-leaves* much smaller, sessile, less lobed, the upper ones heart-spear-shaped, entire. *Flowers* numerous, large and very handsome, of a beautiful bright, but pale, blue, sometimes white, all nearly or quite sessile, growing generally in pairs, in the axils of the uppermost leaves. *Calyx* composed of a double series of scales or leaves, the outer of which are 5 in number, egg-shaped, pointed, somewhat spreading, and edged with glandular hairs; innermost about 8, narrow and equal, forming an angular, clammy cylindar. *Corolla* of about 20, strap-shaped *florets* (see fig. 3.) each with a cylindrical, short, white *tube*, and a flat *limb*, with 5 deep teeth at the extremity. *Filaments* whitish. *Anthers* and *Stigmas* blue. *Seed* somewhat club-shaped, obscurely 4-sided, blunt. *Pappus* of very small, upright, chaffy bristles. *Receptacle* slightly chaffy, with a few slender scales, shorter than the seed.

The fine blue colour of the florets is convertible into a brilliant red by the acid of Ants; and it is said, that in Germany the boys often amuse themselves in producing this change of colour by placing the blossoms in an Ant hill.

In a wild state this very beautiful plant is considered little better than a troublesome weed. Its root is said to be tonic, and in large doses aperient. It has been used in chronic viscera and cutaneous diseases, especially in the form of decoction. A large-leaved variety is sometimes cultivated in gardens as an early salad, and occasionally in the fields, as a fodder for cattle. On the Continent it is of much repute for the sake both of its leaves and root; the latter, when full grown, is cut into slices, roasted, ground down, and used instead of coffee, and, although it was first employed either to adulterate the Mocha drink, or as a poor substitute for it when the berry was too expensive for general consumption, its use is now established, and, when mixed with coffee, it is by some persons believed to improve its flavour. In France the young leaves are used in salads; and the shoots from the root, blanched by being forced in a dark cellar, are much relished as a winter salad, under the name of *Barbe-de-Capucin*. Sometimes the roots are packed among moist sand in a barrel, having numerous round holes pierced in its sides; the crowns of the roots being so placed, that the shoots may readily push their way through the holes; by this method they are kept quite clean, and are very easily gathered as wanted, and repeated cuttings are obtained. See *Mill. Gard. Dict.*; *Neil's Hort. Tour.*; *Burn. Outl. of Bot.*; and *Loud. Encycl. of Gardening*; especially the latter, for further information respecting the culture, uses, &c., of this plant.

Hist. v. i. pt. II. lib. 10. p. 358.—*Eremocallis glomerata*, Gray's Nat. Arr. v. ii. p. 398.

LOCALITIES.—On heaths, and moory ground; frequent.

A small Shrub.—Flowers from June to September.

*Root* creeping. *Stems* numerous, upright, from 4 inches to a foot or more high, branched, leafy, brownish, clothed with projecting hairs; naked at bottom, and very rough from the remains of the leaves which have fallen off. *Leaves* crowded, spreading, on short, somewhat decurrent, petioles, 4 in a whorl, sometimes 5, egg-spear-shaped or oblong, the upper surface covered with dense white down, the margins revolute and nearly smooth, fringed with long projecting bristles, which, in the young leaves, are each tipped with a small round globule; under surface white, with a downy mid-rib. *Flowers* of a delicate wax-like hue, of every shade of rose-colour, sometimes snow-white, on short downy peduncles, collected into a dense, round, terminal, capitate cluster, all elegantly drooping towards one side. *Calyx* oblong; *sepals* strap-shaped, downy, and fringed with glandular bristles. *Corolla* (fig. 2.) about three lines long, nearly egg-shaped, ventricose, a little downy near the mouth, which is small, and 4-cleft. *Stamens* concealed within the corolla; *anthers* with a pair of simple appendages, or horns, at the base of each. *Style* about as long as the corolla, in some flowers slightly protruding. *Capsule* roundish, hairy; *valves* concave, with a fixed partition (dissemination) from the centre of each. *Seeds* numerous, very small, egg-shaped, yellowish, minutely pitted. Whole plant of a greyish hue.

In June, 1833, Mr. LEIGHTON found on the Vownog Bog near Westfelton, Shropshire, a plant of this species having the corolla cleft into several divisions, and the place of the stamens occupied by petal-like segments bearing imperfectly developed lobes of anthers; a few perfect stamens were also present. The same transformation in the corolla of this species had been previously observed by W. C. TREVELYAN, Esq. See *Hook. Brit. Fl.* (1st ed.) p. 176.

*Erica tetralix* is a native of most parts of the North of Europe, in boggy or moory ground. It is a handsome little plant, and well worthy a place in the flower garden. Sir J. E. SMITH observes, "It is wonderful that this most elegant, and not uncommon, plant is scarcely delineated at all by the old authors, nor by any of them correctly." It is the badge of the Scottish Clan MACDONALD. In the language of flowers, *Heath* is made the emblem of solitude; and thus, when the lover presents his mistress with a bouquet of heath and pansies, she understands his heart would be at ease, if his solitude were blessed by her society.

" Some poets praise the violet's hue,  
And some the lily's lightness;  
Some Scotland's bells of bonny blue,  
And some the rose's brightness;  
But, oh, give me the heath in bloom,  
That, on the wild moor growing,  
So sweetly scatters its perfume  
When wint'ry winds are blowing'

" Rich odours seethe the mignonette,  
And fill the young May-flower;  
And there's a softer fragrance yet  
Breathes in the jessamine bower.  
But, oh, give me the heath in bloom,  
That, on the wild moor growing,  
So sweetly scatters its perfume  
When wint'ry winds are blowing."

J. L. STEVENS.

† See folio 48, note †.

‡ See folio 235, a.

**LOCALITIES.**—In salt-marshes; very rare.—*Essex*; At Walton, near Harwich: **RAY**.—*Kent*; About a quarter of a mile below Faversham, by the river side: Mr. J. SHERARD. On the wall leading to Thorn Creek, near Faversham, plentifully: E. JACOB, Esq. About three miles east of Whitstable: 1824; Mr. W. PAMPLIN, jun. *East Kent*: Rev. G. E. SMITH, in N. B. G.—*Notts*; Wood at Colwick: **MARTYN**.—*Sussex*; In the ditches near Shoreham, according to **RAY**, but it has been sought for there in vain; it is probable *Enanthe pimpinelloides* was mistaken for it.

**Perennial.**—Flowers from June to September.

**Root** spindle-shaped, with strong, branching fibres, resinous, smelling like sulphur. **Stem** upright, from 2 to 4 feet high, cylindrical, branched, striated, bright green, jointed, smooth, leafy. **Leaves** copious, alternate, on channelled leaf-stalks, sheathing at the base, large, 4 or 5 times 3-parted, their ultimate segments about an inch and a half long, very narrow, strap-shaped, and almost hair-like, flat, pointed, 3-ribbed. **Universal umbel** large, of many unequal, smooth, lax rays, and an *involucrum* of about 3 narrow bristle-shaped, deciduous leaves (bracteas). **Partial umbels** also of many unequal rays, with an *involucrum* of many permanent bristle-like leaves. **Flowers** numerous, of an uniform buff-yellow. **Calyx-teeth** sharp pointed, bent inwards. **Petals** equal, incurved. **Styles** reflexed. **Fruit** about 3 lines long, oblong, with a shallow notch at each end, pale light brown, the *vittæ* deep chocolate colour, the primary ribs much depressed and paler, the lateral resembling deep furrows between them and the dilated margin. **Commissure** (inner face of the carpels) light fawn colour, with two crimson *vittæ* very conspicuous upon it. (See *Lindl. Fl. Med.*)

This species is a native of the most southern parts of Europe in moist meadows. The whole plant, especially the *root*, has a strong sulphurous smell. The latter wounded in the Spring yields a considerable quantity of yellow juice, which dries into a gummy resin, and retains the strong scent of the root. Many stimulating qualities have been attributed to it, but it is considered dangerous for internal use.

---

“ Nor is the mead unworthy of thy foot,  
Full of fresh verdure, and unnumber'd flowers,  
The negligence of Nature, wide, and wild;  
Where, undisguished by mimic art, she spreads  
Unbounded beauty to the roving eye.”

THOMSON.

*tenuifolia*, Johnson's Gerarde, p. 247, with a figure.—*Lob.* Ic. p. 205, with a figure.—*Valencia Cress*, Petiv. H. Brit. t. 50. f. 5.

LOCALITIES.—In sandy fields, but very rare.—*Wiltshire*; Found by Mr. LAWSON on Salisbury Plain, not far from Stonehenge: RAY, (1690). Not found there since.

Annual.—Flowers in June. DON says in February and March, in gardens.

Root small, tapering, fibrous. Stem upright, from 3 to 9 inches high, branched, leafy, rough with deflexed bristles. Leaves scattered, doubly pinnatifid, with strap-shaped, bluntish, decurrent segments. Racemes opposite the leaves, upright, elongated; pedicels short, thread-shaped, without bracteas. Flowers small. Calyx (see fig. 1.) tubular, shining, purplish, closed with the sepals converging longitudinally. Petals (see fig. 2.) inversely heart-shaped, entire, pale yellow, with deep purple veins, and very slender claws. Pouch (*silicle*) (see fig. 4.) pendulous, nearly globular, 2-celled, and 2-valved; valves crustaceous, with 3 raised, bristly ribs, on the outside; polished and shining within. Partition parallel to the valves, very thin, and almost transparent, surmounted by the egg-shaped, curved, smooth, ribbed, rigid style. Seeds 3 or 4 in each cell, nearly globular, angular, of a dark rusty-colour; DECANDOLLE remarks, that they became covered with a glutinous exudation, on being immersed in warm water. The expanded cotyledons, remaining for some time on the stem, are inversely heart-shaped, flat, quite smooth and even. See Sm. Engl. Fl. and Mart. Mill. Gard. Dict., &c.

This curious little plant is a native in sandy and waste fields, and along way and wall sides in Spain, Balearic Islands, Mauritania, Sicily, Greece, and Syria. In England it is a very doubtful native, having been found only once, as recorded above. The whole herb is acid and pungent to the taste, and might, if required, be used as a condiment.

The drawing for the accompanying plate was made from a well preserved specimen in the *Sherardian Herbarium*.

---

" Stoop where thou wilt, thy careless hand  
Some random bud will meet :  
Thou canst not tread but thou wilt find  
The daisy at thy feet.

'Tis like the birthday of the world,  
When earth was born in bloom ;  
The light is made of many dyes,  
The air is all perfume ;  
There's crimson buds, and white and blue—  
The very rainbow show'rs  
Have turn'd to blossoms where they fell,  
And sown the earth with flow'rs."

\* So named by BOERHAAVE in honour of Dr. PETER HOTTON, who was curator of the Leyden Botanic Garden, as well before the return of HERMANN as after his decease; and on the last occasion was the immediate predecessor of BOERHAAVE. He published, *Sermo Academicus, quo rei herbariae historia et fata adumbrantur*. 1695, 4to. D. TURNER, Esq. in *Correspondence of Dr. RICHARDSON*, p. 17.

† See fol. 48, note †.

‡ See fol. 296, a.

**LOCALITIES.**—In ditches and ponds, on a gravelly soil.—Not unfrequent in many counties of England; also in Wales.—It has not been found in Scotland; and it is rare in Ireland: Mr. MACKAY informs us, in his excellent *Flora Hibernica*, that it was first found in that country about the year 1818, in ditches or drains near Downpatrick, by Dr. KENNEDY, then a young and promising Botanist, who died shortly afterwards.

**Perennial.**—Flowers in May and June.

*Root* creeping, sending out many white slender fibres, which strike deep into the mud. *Stems* trailing, round, leafy. *Leaves* all under water, numerous, crowded, smooth, 3 or 4 inches long, bright green, deeply and regularly pinnatifid, with strap-shaped segments. *Stalks* central, solitary; naked below, rising above the water, and bearing several whorls of flowers one above the other, and forming, altogether, a handsome spike. *Flowers* large and handsome, of an elegant pink or deep rose-colour, with a yellow centre; from six to ten in a whorl, each on a slender partial-stalk, which bends downwards when the flowers are over. *Bracteas* strap-shaped, one at the base of each partial-stalk. Both the general and partial stalks, as well as the bracteas and calyx, are covered with a glandular viscid pubescence. Sometimes the flowers have six stamens, and then the calyx and corolla are each divided into six segments. A variety with a red flower was found near Kelmarsh, in Northamptonshire, by Mr. RUDGE.

The *Hottonia* is one of the most beautiful of our native plants, and is highly deserving a place with *Nymphaea* (t. 181), *Nuphar* (t. 281.), *Batumus* (t. 34.), *Sagittaria* (t. 109.), *Villarsia* (t. 161.), and *Menyanthes* (t. 245), in the ornamental Aquarium. The flowers are numerous, and very elegant, and are produced in whorled clusters, raised above the water. The leaves are all under water, and afford a refuge, and perhaps nourishment, to the fresh-water Periwinkle and other small shell-fish.

---

#### THE SUMMER'S CALL.

" Come away ! the sunny hours  
Woo thee far to founts and bowers !  
O'er the very waters now,  
In their play,  
Flowers are shedding beauty's glow—  
Come away !  
Where the lily's tender gleam  
Quivers on the glancing stream—  
Come away !

All the air is filled with sound,  
Soft, and sultry, and profound;  
Murmurs through the shadowy grass  
Lightly stray ;  
Faint winds whisper as they pass—  
Come away ;  
Where the bee's deep music swells  
From the trembling foxglove bells—  
Come away !

In the deep heart of the rose  
Now the crimson love-hue glows ;  
Now the glow-worm's lamp by night  
Sheds a ray,  
Dreamy, starry, greenly bright—  
Come away !  
Where the fairy cup-moss lies,  
With the wild-wood strawberries,  
Come away !

MRS. HEMANS.

*Corallorrhiza innata* Spurless Coral-root. 2

Hooker's beautiful work, the *Flora Londinensis*.

\* From *corallion*, Gr. *coral*; and *riza*, Gr. a *root*; alluding to the curious structure of the root, like coral.

† See fol. 8, note †.

‡ See fol. 387, a.

§ See fol. 33, note ‡.

**LOCALITIES.**—Marshy woods in Scotland, rare.—*Ayrshire*; Sandy places near the sea close by *Ayr*: Mr. *GOLDIE*.—*Edinburghshire*. Fir-wood at the end of Ravelrig Marsh, very abundant; Mr. *J. MACNAB*, in N. B. G. And among the willows: Mr. *H. C. WATSON*, in N. B. G. In a peat-bog among willows, a little to the south of Dalmahoy Hill, nine miles from Edinburgh: Mr. *E. J. MAUGHAN*.—*Fifeshire*; Near Dunfermline: Mr. *W. BRAND*, in N. B. G.—*Forfarshire*; Sands of Berrie: Mr. *T. DRUMMOND*.—*Perthshire*; Formerly found in the woods of Methven Castle: N. B. G.—*Ross-shire*; In a moist hanging wood, on the south side near the head of Little Loch Broom: *LIGHTFOOT*.

**Perennial.**—Flowers from June to September.

**Root** of many thick, fleshy, pale-brown or yellowish, short, blunt fibres, which are branched like coral, the branches distinct, not touching each other. **Leaves** none. **Scape** solitary, upright, from 6 inches to a foot high, round, striated, smooth, of a pale brownish-yellow colour, furnished with about three distant, tubular, loosely sheathing scales of the same hue. **Flowers** few, in a loose terminal spike or cluster, drooping at first, of a pale yellowish colour. **Bracteas** small, egg-spear-shaped, greenish. **Peduncles** very short, curved, finally upright. **Germen** (fig. 1. b.) smooth, incurved, bluntly angular. **Sepals** (fig. 1. c, c, c.) spear-shaped, spreading, greenish with a tinge of red. **Petals** (fig. 1. d, d.) spear-shaped, pale yellow, often reddish at the points, converging under the upper sepal. **Lip** (see figs. 1 & 4.) curved downwards, inversely egg-shaped, or oblong, with a slight contraction in the middle, below which, towards the base, are two shallow rounded lobes, the whole white or pale yellow, more or less spotted with red. **Spur** not apparent, or so short as to be altogether adnate with the lip. **Column** (fig. 1. e. and figs. 2 & 3.) elongated, strap-shaped, convex at the back; channelled in front; of a yellowish colour; crowned with the vertical **anther** (fig. 6.) in the form of a lid, and attached behind as by a hinge. **Pollen-masses** (fig. 5.) 2 in each cell, egg-shaped, pale green, placed obliquely, of a waxy consistency. **Stigma** almost square, covered by the anther. **Capsule** elliptical, with 3 blunt ribs, and crowned with the permanent withered flower. See *Sm. Engl. Fl. and Hook. Fl. Lond.*

This is one of the most rare, as well as one of the most singular of the British Orchideous plants. It is said to be a native of Switzerland, Carniola, and the south of France; but it has been found nowhere in these islands except in Scotland.

The first time LINNÆUS met with this rare and curious plant in a living state, was on the 19th of June, 1732, old style, in the island of Longoen, three miles from Old Pitheoia, in Lapland; it was growing under a Spruce Fir, and was at that time in full bloom. It appears, from the *Flora Lapponica*, not to be very unfrequent in that country.

The plant seems to admit of some curious varieties; Mr. WOODWARD describes a specimen, in his possession, in which the lower sheath terminates in a real spear-shaped leaf, upright, somewhat approaching, half an inch long, two lines broad; and above this two others which are shorter. And we are informed by DR. GREVILLE, in his *Flora Edinensis*, p. 187, that he possesses a highly curious monstrosity of this plant from Ravelrig-toll, near Edinburgh, in which all the flowers on one individual, have the 2 outer of the 3 upper connivent segments of the perianth converted into lips, as large as the true lip, deflexed, and beautifully spotted; the 3 remaining segments appearing between them like a 3-leaved calyx, and the column of fructification standing in the centre wholly unprotected, and terminated by the anther.

LOCALITIES.—In dry, barren, gravelly, and sandy fields, and margins of gravel-pits, &c.—Frequent in many counties of ENGLAND, WALES, and SCOTLAND, especially in the following:—*Beds*; *Berks*; *Bucks*; *Cambridge*; *Cheshire*; *Cumberland*; *Derby*; *Devon*; *Essex*; *Hants*; *Leicester*; *Middlesex*; *Norfolk*; *Northampton*; *Northumberland*; *Notts*; *Salop*; *Stafford*; *Suffolk*; *Surrey*; *Sussex*; *Warwick*; *Westmoreland*; *Worcester*; *York*;—*Anglesea*; *Denbigh*; *Glamorgan*; *Montgomery*;—*Aberdeen*; *Ayr*; *Berwick*; *Elgin*; *Forfar*; *Lanark*; *Perth*; and *Roxburgh*.—It has not, I believe, been found in IRELAND.

Annual.—Flowers in May and June.

Root slender, tapering, with whitish fibres. Stems several, from 2 to 5 inches high, upright or spreading, slightly leafy, the central one quite straight, and always naked. Leaves numerous, spreading on the ground, almost entirely radical, partly undivided, but mostly pinnatifid in a lyrate manner, segments rounded, often slightly hairy at the edges, otherwise smooth. Flowers small, white, in a terminal corymb, which elongates into a spike-like raceme as it advances in flowering. Sepals egg-spear-shaped, concave, equal, reddish. Petals unequal, the two outer thrice the size of the other two. Stamens always 6, remarkable for their large white scales (see fig. 5), which were first observed in this species by the late Mr. SOWERBY. Pouch (*silicle*) (see fig. 6.) somewhat inversely heart-shaped, laterally compressed, concave on one side, convex on the other, bordered with a projecting margin, and marked with a perpendicular line, which is the edge of the partition. Valves keeled, smooth, veiny. Seeds 2 in each cell, round, compressed, very minutely dotted.

There is another species, the *Teesdalia regularis* of SMITH, (*Lepidium nudicaule* of LINNÆUS,) which is said so precisely to resemble our plant in habit, as to have been sometimes confounded with it; but it may be readily distinguished by its petals being equal, and by its having usually only 4 stamens, very rarely 6. It is, moreover, entirely exotic, having never been found wild in Britain, but appears to be confined to the south of Europe, where it inhabits sandy, barren, somewhat wooded places, especially in Spain and Portugal. Our plant, on the contrary, is found only in the more northern parts of Europe, as in Britain, France, Germany, Denmark, and Sweden.—Some interesting observations, by the late Sir J. E. SMITH, relating to the history, &c., of these two curious little plants, may be seen in the 11th volume of *The Transactions of the Linnean Society of London*, p. 283 to 287.

LOCALITIES.—In stagnant water in ponds and ditches, everywhere.

Annual.—Flowers in June and July.

*Root* a solitary fibre, with a calyptre-like extremity (see fig. 15). *Fronds* (see fig. 1.) numerous, collected together, floating on the surface of the water, egg-shaped or roundish, each about a line or a line and a half long, proliferous and gemmiferous (see fig. 2.), minutely cellular, nearly flat on the upper side, slightly convex on the under, with a depression in the centre, from whence the root proceeds. *Flowers* (see figs. 9 & 12.) monœcious, very minute, destitute of both calyx and corolla, and enclosed, 2 together (1 sterile and 1 fertile one), in a thin membranous, beautifully reticulated spatha or sheath, (see figs. 5 to 8.) which proceeds from a cleft in the margin of the frond towards the base (see fig. 4.). *Sterile Flower* composed of 2 *stamens* only, their filaments thread-shaped, longer than the spatha, and terminated with a yellow *anther* of 2 distinct, globular lobes, which open at the top; *grains of pollen* (see fig. 11.) yellow, roundish, covered with small points. *Fertile Flower* (see fig. 12.) a *pistil* only, with an egg-shaped *germen*, a cylindrical, short *style*, and a blunt, flattish *stigma*: “a frond and 2 flowers thus constituting the whole of the plant.” *Pericarpium* (see fig. 14.) a *utricle* of a roundish shape, somewhat depressed on one side, externally cellular, crustaceous within, terminated by the permanent style, which, according to the observations of the Rev. G. W. SANDYS, who favoured me with several sketches of the fructification of this little plant, in July, 1838, was always, in the specimens which he examined, bent at an angle. *Seed* solitary, horizontal, with its hilum directed towards the narrow end of the frond.

This species of *Ducks'-meat* is common in most parts of Europe. With us there is scarcely a pond or ditch of stagnant water, where it is not to be seen floating on the surface, and often increasing so rapidly by means of *gemmæ* or *buds* (see figs. 2 & 3.) produced from clefts in the margins of the fronds, as well as by seed, that it frequently becomes so crowded, as to form large dense masses, which entirely conceal the water on which they float. It is considered to possess the property of purifying the unwholesome air in marshy places, absorbing this air during the day, and exhaling oxygen during the night.—Ducks and geese are fond of it, and it affords nourishment and protection to a great variety of Infusoria and other interesting aquatic objects.—It appears to be very tenacious of life, as an instance is recorded of some plants of it being taken from a pond in July, 1797, dried for 4 or 5 hours in the sun, and then put into a small box and preserved, in a dry state, till the end of March, 1800; when they were placed in a glass jar with water, where they not only revived, but flowered in the following August. It also possesses great power in resisting decay, as is proved by a circumstance which came under the observation of that excellent naturalist, the Rev. W. T. BREE, of Allesley, near Coventry, and which is described in the 9th volume of LOUDON'S *Gardeners' Magazine*, p. 124.

---

The Natural Order PISTIACEÆ is composed of floating monocotyledonous frondose plants, with 2 naked flowers, inclosed in a spatha, and appearing from the margin of the frond. The sterile flowers consist of a definite number of stamens; the fertile ones of a 1-celled ovary, with one or more erect ovules; a short style; and a simple stigma. The fruit is membranous or capsular, indehiscent, and 1- or more-seeded. The seed has a fungus testa, a thickened indurated foramen; and the embryo either in the axis of a fleshy albumen, and having a lateral cleft for the emission of the plumule, or at the apex of the nucleus.—*Lemna* is the only British genus in the order.

Cliffs between Whitby and Land's End: Mr. BAINES, in *Fl. of Yorksh.*

### Shrub.—Flowers in April and May.

A bushy rigid *Shrub*, from 5 to 8, or 10 feet high, in a wild state; with numerous, irregular, spreading, leafy branches, covered with a brown scaly bark, and each terminating in a *thorn*. *Leaves* numerous, scattered, deciduous, strap-spear-shaped, bluntnish, very entire, an inch and a half, or nearly two inches long, and about a quarter of an inch broad, on very short petioles; dark green on the upper surface, with circular, silvery, scale-like dots, each accompanied by a tuft of white radiating hairs, which, viewed under the microscope, greatly resemble *Erysiphe adunca*, so beautifully figured by Dr. GREVILLE, in his *Scottish Cryptogamic Flora*, t. 296.; under surface of a shining silvery-white, with scattered tufts of hair similar to those on the upper. *Flowers* green, very small, in the bosoms of the leaves while very young (see figs. 1 & 2). *Fruit* (fig. 10.) berry-like, formed of the enlarged, permanent, fleshy calyx, somewhat stalked, rather elliptical, orange-coloured, very acid, with an austere vinous flavour.

This plant is a native on sandy sea-coasts in many other parts of Europe as well as in England; but it has not been found wild either in Wales, Scotland, or Ireland. It is often cultivated in gardens on account of the beauty of its grey, silver-looking foliage. Every part of the plant abounds in colouring matter, which is used as a yellow dye. The berries afford a kind of sauce to the poor in Sweden and the south of France. They are a favourite food with the Tartars, who make a jelly or preserve of them, and serve them up with milk or cheese, as great dainties; and the fishermen in the Gulf of Bothnia eat them with their fish. They are entirely harmless, although in Dauphiny and Spain they are considered poisonous. J. J. ROSSEAU gives an account of his having made a botanical excursion in the neighbourhood of Grenoble, with a local botanist, who, though he saw him eating the fruit, which he believed to be poisonous, was so polite, or regarded ROSSEAU with so much respect, that he durst not presume to warn him of his danger; and was astonished that death did not ensue when he saw him eat the berries so plentifully.

---

The *Natural Order ELÆAGNEÆ* is composed of dicotyledonous *shrubs* or *trees*, with entire, exstipulate *leaves*, which are covered, as well as the bark, with minute silvery scales. Their *flowers* are apetalous, and mostly diœcious. The *sterile flower* consists of a 2- or 4-parted *calyx*, and 3 or more *stamens*, with 2-celled *anthers*. The *fertile flower* has an inferior, tubular, permanent *calyx*, with an entire, or 2- to 4-toothed limb. The *ovary* is 1-celled, with a solitary *ovule*. The *fruit* is crustaceous, and enclosed within the *calyx*, which has become fleshy; and the *seed* is erect; with a straight *embryo*, surrounded by very thin fleshy *albumen*.—*HIPPOPHAE* is the only British genus in the order.

G.—*Norfolk*; On Bawdsey Bottom near Lynn: B. G.—*Northumberl.* Turfy bogs, on moors. Prestwick Carr; and near Shewing Shields: N. J. WINCH, Esq.—*Notts*; common: N. B. G.—*Shropsh.* Clee Hills; Ellardine Moss; near Ellesmere, abundantly; Hancott Bog; bog near Ellesmere; Felton Farm, near Ludlow; Bomere Pool, near Shrewsbury; Knockin Heath; and Vownog Bog, near Westfelton: *Fl. of Shropsh.*—*Somerset*. On Glastonbury, and Buttle Tuft-moors, abundantly: B. G.—*Surrey*; Leigh Hill Common, near Dorking; and boggy parts of Shirley Common, near Croydon: B. G.—*Sussex*; Amberley Wildbrooks, and neighbouring bogs; Broadwater Common near Tunbridge Wells: B. G. Mr. W. PAMPLIN, jun. doubts whether it has been found on Broadwater Common, of late years.—*Warwicksh.* Bannersley Pool; bog below Coleshill; Birmingham Heath, in the marshy valley, crossed by the footpath to Winsor Green; and near Packington: N. B. G.—*Westmoreland*; common: B. G.—*Worcestersh.* rare: N. B. G.—*Yorksh.* On high barren moors. Cronkley Fell; Richmond; Blackmoor, near Leeds; Heath north-west of Terrington Carr; and on Black Bird Moor, both near Castle Howard; Tanfield Carr; bog in the Ox Close, near Ripon; near Beverley; Moors between Hambleton and Helmsley; Moors near Gearstones; on Cockit Moss and Hellet Moss, near Settle; and at the foot of Pennigent Hill: BAINES' *Fl. of Yorksh.*—*WALES.* Frequent in the counties of Brecknock; Carmarthen; Caernarvon; Denbigh; Flint; Glamorgan; Merioneth; and Monmouth.—Not uncommon in turf-bogs and barren Moors in SCOTLAND and IRELAND, especially in mountainous districts.

### Perennial.—Flowers in March and April.

*Root* slightly creeping. *Culms (stems)* tufted, jointed, smooth, triangular at the top, round below, upright, shorter than the leaves when in flower, but finally becoming much longer, with several inflated, strongly reticulated sheaths in the lower part, one or two of them elongated into leaves. *Leaves* numerous, upright, slender, triangular, striated, sharp-pointed. *Spike* (see fig. 1.) solitary, terminal, somewhat acuminate, silvery-grey when in flower. *Glumes* (see fig. 2.) with long points, thin, membranous, shining, single-ribbed. *Anthers* prominent, yellow. *Fruit* triangular, rough with minutely elevated points.

This is an elegant grass, especially when in seed, at which time its spikes are very conspicuous, resembling tufts of the finest white silk or cotton. Sheep are said to be very fond of this grass, but its produce is very scanty; and Mr. SINCLAIR remarks, that as far as he had opportunity to observe, they only crop the foliage in the Spring, till the finer natural grasses afford them a bite. The long silky hairs which spring from the base of the fruit of this and some other species of the same genus, have been attempted to be manufactured into cloth, paper, &c., but from the brittleness of their texture most of the attempts have failed.

Lough Carlan, a little N. W. of the Gap of Barnesmore, Donegal. Said to have been found in Lough Neagh, by SHERARD: *Fl. Hibern.*

### Annual.—Flowers in July.

**Root** of many, long, white, simple fibres. **Stem** none. **Leaves** all radical, awl-shaped, spreading, smooth, (as is the whole plant,) from 1 to 2 inches long. **Scape** (*flower-stalk*) upright, somewhat zigzag, from 2 to 4 inches high; usually wholly under water. **Flowers** few, white, very minute, racemose; *pedicels* alternate, slender, single-flowered. **Pouch** (fig. 7.) upright, oval, smooth, tipped with the sessile roundish stigma; *valves* (see fig 8.) convex, tumid. **Seeds** (see figs. 8 & 9.) oval, smooth. **Embryo**, (see fig. 10.) curved above the base of its long, strap-shaped cotyledons.

It is a native of other colder parts of Europe besides Britain, as Lapland, Sweden, Norway, Germany, &c. It is singular that this curious little plant should blossom several feet below the surface of the water. According to Sir J. E. SMITH and Sir W. J. HOOKER, the flowers always remain entirely under that element, even during the time they are expanded; thus forming a remarkable deviation from the general rule, for water-plants almost invariably elevate their flowers above the water before the petals open, in order that fertilization may take place in air. That it does sometimes flower out of the water, appears from the following observations of the Rev. HUGH DAVIES. “In the dry summer of 1798,” says Mr. DAVIES, “as I walked the bed of a lake called Llyn Llywenan, in the parish of Bodedern, [Anglesea,] whence the water had retired about two months before, I, unexpectedly, discovered this plant in great abundance. Notwithstanding its appearance was very different from what I had been used to see in the Arvonian Alpine Lakes, where it always blossoms and seeds at the bottom, under water of considerable depth, yet it did not seem to regret the privation; the foliage was spread, the leaves somewhat reclining, and the flowering stems procumbent; the calyx and corolla were fully expanded; the petals, which are white, and of an obovate form, were horizontal, the seed-vessels and seed quite perfected; and, on the whole, it seemed to indicate a quite different plant.” *Welsh Botanology*, p. 61.

*Pyrrhosia hederifolia. Marsh Whortle-berry. 5*

Pubd. by W. B. Easter. Botanic Garden, Oxford. 1841.

## OXYCO'CCUS\*.

*Linnean Class and Order.* OCTA'NDRIA†, MONOGY'NIA.

*Natural Order.* VACCINIE'Æ, Dec.—Lindl. Syn. p. 134.; Intr. to Nat. Syst. of Bot. p. 184.—Loud. Hort. Brit. p. 523.—Mack. Fl. Hibern. p. 135.—Hook. Brit. Fl. (4th edit.) p. 411.—ERICÆ, Juss. Gen. Pl. p. 159.—Sm. Gram. of Bot. p. 115.—ERICA'CEÆ; tribe, VACCINIE'Æ, Don's Gen. Syst. of Gard. and Bot. v. iii. pp. 785 and 789.—Loud. Arb. et Frutic. Brit. pp. 1076 & 1078.—ERICINEÆ; sect. VACCINIE'Æ, Rich. by Macgilliv. pp. 151 & 152.—SYRINGALES; subord. ERICOSÆ; sect. ERICINÆ; type, VACCINIA'CEÆ; Burn. Outl. of Bot. v. ii. pp. 900, 937, & 944.—BICORNES, Linn.

**SPEC. CHAR.** *Calyx* (see figs. 2 & 3.) superior, of 1 sepal, small, permanent, 4-lobed. *Corolla* of 4 somewhat strap-shaped, reflexed petals. *Filaments* (see figs. 1 & 2.) 8, awl-shaped, flattened, conniving, inserted into the receptacle, equal. *Anthers* (see fig. 1.) terminal, upright, oblong, tubular, with 2 points, opening by a terminal pore in each. *Germen* (see fig. 2.) inferior. *Style* (see fig. 3.) simple, cylindrical, upright, longer than the stamens (see fig. 2.). *Stigma* blunt. *Berry* (figs. 4 & 5.) globular, 4-celled, many-seeded. *Seeds* small, angular.

The superior, 4-toothed *calyx*; the *corolla* of 4 strap-shaped, reflexed petals; the elongated *anthers*, opening by terminal pores without dorsal appendages; and the globose, 4-celled, many-seeded *berry*; will distinguish this from other genera in the same class and order.—It differs from *Vaccinium* (t. 383), in the *corolla* being entirely reflexed, and (at least in the British species) 4-petaled.

One species British.

LOCALITIES.—In watery turf bogs, among mosses. Common in the North of England, as well as in the East, as in Lincolnshire, and the neighbouring part of Norfolk; and also in WALES, SCOTLAND, and IRELAND.

Shrub.—Flowers in May and June.

Roots creeping, with many long fibres. Stems straggling, slender, wiry, from 6 to 10 inches long, trailing and creeping, smooth, branched, leafy, with a deciduous cuticle. Leaves alternate, on very short petioles, egg-shaped, or somewhat heart-shaped, pointed, smooth, entire, their margins revolute; green and glossy above; glaucous beneath. Flowers very elegant, drooping, of a pink or rose-colour, each on a simple, red, slightly hoary peduncle, about an inch long, several together at the end of each branch, bearing a few minute scattered bracteas below the middle. Calyx (see figs. 2 & 3) small, coloured, smooth, in 4, blunt, slightly fringed, segments. Corolla (in all the specimens I have examined) of 4 distinct, reflexed petals, which fall off separately. Filaments (see figs. 1 & 2.) flat, incurved, purple, with fringed margins. Anthers upright, prominent, yellow, with two long tubular points, but no horns. Berries nearly globular, pale red spotted with purple in an early state, when fully ripe of a deep red.

A low, evergreen, trailing shrub, seldom rising higher than three or four inches. As well as of Europe, it is also a native on the boggy mountains of North America, from Canada to Pennsylvania, and in the Island of Oonalashka. PALLAS says it is also found in turf bogs throughout the whole of Siberia, as far as the Northern Ocean. In Russia, and in some parts of Sweden, the long thread-shaped shoots are collected in the Spring, after most of the leaves have dropped off, and are dried, and twisted into ropes, which are used to tie on the thatch of houses, and even for harnessing horses. The berries are powerfully acid and astringent, and they have a peculiar flavour, which is agreeable to some, though disliked by others. Immersion in water for some hours is said to remove their disagreeable bitterness. In Sweden and Russia they are used for tarts and sweetmeats, and the expressed juice is considered efficacious in fevers. PALLAS informs us, that bankers in Russia make use of the fruit for whitening their silver money, which they do by boiling it in the juice, when the sharp acid dissolves the superficial particles of the copper alloy. The same thing is done in Sweden to whiten silver plate. In Britain, almost the only use to which the berries are applied, is that of making tarts; and not long since Cranberries from Lincolnshire, and the north-west corner of Norfolk, were sold in the streets of Norwich by cart-loads; but the extensive inclosures have now, in many parts, destroyed and drained their native bogs, and rendered them more scarce in a wild state. It is recorded by LIGHTFOOT, (in his *Flora Scotica*, published in 1789,) that at Longtown on the borders of Cumberland, they were made so considerable an article of commerce, that at the season when they were ripe, not less than 20 or 30 pounds worth were sold by the poor people each market-day, for five or six weeks together, which were afterwards dispersed over different parts of the kingdom, for making Cranberry-tarts. England is now chiefly supplied with Cranberries from Russia and Sweden, and with the sort produced by *O. macrocarpus* from N. America. The total quantity imported from both countries, according to M'CULLOCH, is from 30,000 to 35,000 gallons annually. (See *Loud. Arb. et Frutic. Brit.* p. 1169).

Geats eat the plant; cows, sheep, and horses refuse it.

*Hysterium melaleucum* is sometimes parasitical on the leaves.

For the plant from which the drawing for the accompanying plate was made, I am indebted to the kindness of Mr. J. THOMPSON, of Crowhall Mill, Northumberland.

*Turnera glabra. Smooth Tower-mustard.*

Mathews Del & Sc

Pubd by W. Baillie Botanic Garden Oxford 1861.

## TURRITIS \*.

*Linnean Class and Order.* TETRADYNA'MIA†, SILIQUO'SA‡.

G.—*Worcestersh.* Near an old Stone-quarry, between the Mitre Oak and Stourport; on hedge-banks in the lanes about Kidderminster and Stourbridge; and near Hartlebury: N. B. G.—*Yorksh.* Sowerby fields; between Thirsk and Kilvington; at Darfield, near Sheffield; on the right hand side of the road from Green Hammerton to Boroughbridge; and in the lane between Brompton and Catteric Bridge: *Fl. of Yorksh.* Near Richmond; Rotherham; Ripon; and Halperby: N. B. G.—**SCOTLAND.** *Dumbartonshire*; In the wood opposite the inn, Bowling Bay; sparingly: HOPKIRK.

#### Annual.—Flowers in May and June.

*Root* tapering. *Stem* upright, straight, from 2 to 3 feet high, simple, cylindrical, solid, smooth and glaucous, except at the very base, which is clothed with soft deflexed hairs. *Root-leaves* spreading, toothed or sinuated; hairy. *Stem-leaves* numerous, upright, oblong-arrow-shaped, generally entire, but occasionally slightly toothed, glaucous, quite smooth, somewhat arrow-shaped and stem-clasping at the base. *Flowers* numerous, yellowish-white, in a close corymb. *Pods* very long and slender, smooth and even, upright, lying close to the stem so as to conceal it, nearly cylindrical; the valves single-ribbed. *Seeds* about 60 in each cell, minute, inversely egg-shaped.

A native of most parts of Europe, in dry exposed situations; and also of N. America, from Hudson's Bay to the Rocky Mountains, and as far North as lat. 64°.

† See folio 143, note †.      ‡ See folio 106, note †.

## Shrub.—Flowers in May.

A low, evergreen, bushy *shrub*, seldom rising more than three or four feet high; and sending out many spreading, tough, leafy branches, which incline on every side, and are covered with a smooth, brown or reddish bark, with a tinge of purple. *Branches*, when young, somewhat triangular, or quadrangular, the angles occasioned by tubular ridges which contain an abundance of resinous matter; these ridges disappear on the older branches, and the bark becomes cracked and scaly. *Leaves* spreading, three in each whorl, strap-shaped, straight, entire, with a fine sharp point; channelled and glaucous above; convex, keeled, and dark green, beneath; the margins sometimes roughish. *Flowers* axillary, sessile, small; the sterile ones (fig. 1.) discharging a copious cloud of yellow *pollen*; fertile ones (fig. 5.) green, on scaly stalks; these are succeeded by roundish berries, which continue on the bush two years, and are first green, but, when ripe, are of a dark purple or blackish-blue colour, covered with a bloom. Each berry contains three seeds or nuts (see fig. 7.) and is marked at the top with three raised dots, and a 3-forked groove.

In a wild state this is usually a low shrub, but when cultivated it will attain the height of 10 or more feet; and Mr. LOUDON, in his excellent *Aboretum et Fruticetum Britannicum*, records a tree of this species at Wardour Castle, which is 30 feet high, and is supposed to be the largest in England. The *Juniper* is obnoxious to the growth of grass, none, in general, being found to grow under it; but it is said, that the *Avena pratensis*, or *Meadow Oat-grass*, will in turn destroy it. The wood is hard and durable, is finely veined, of a yellowish-brown colour, and very aromatic; and from its beauty, and the high polish it will take, it is employed for walking-sticks, cups, and various articles of turnery, and also for veneering, &c. It makes excellent fuel, and is used in Scotland and Sweden for smoking hams. The bark is made by the Laplanders into iopes. The berries are spicy and stomachic, and are esteemed in medicine as being stimulating and diuretic, their properties depending on an essential oil which they contain; when boiled they yield a considerable quantity of sugar; and LINNEUS states, that such a decoction, when fermented, forms a common drink in Sweden; they are, however, now principally used in making gin, which is simply a spirit distilled from corn, and flavoured by an infusion of these berries, but oil of turpentine is too often substituted for them, which, though it nearly resembles them in flavour, has none of their virtues. Horses, sheep, and goats are said to eat the *Juniper*, and various mountain birds feed on the berries. *Podisoma Juniperi communis*, FR. is sometimes parasitical on the living branches; and *Hysterium Juniperi*, GREV. on the dead leaves of this species.—*Juniperus nana*, SM. Engl. Fl. is considered by many authors as a prostrate variety of *J. communis*.

---

The *Natural Order CONIFERÆ* is composed of *trees* or *shrubs*, which abound in resin. Their *leaves* are strap-shaped, spear-shaped, or needle-shaped. Their *flowers* monœcious or diœcious; with the *sterile florets* arranged on a deciduous catkin about a common rachis; and the *fertile ones* usually in cones, sometimes solitary. The *ovules* are upright, and naked, sometimes seated in an envelope, which in *Taxus* becomes succulent. The *nuts* are either solitary and naked, or enclosed within the hardened scales of a woody cone. *Embryo* with from 2 to 10 *cotyledons*.—The British genera are *Pinus*, t. 389.; *Taxus*, t. 222.; and *Juniperus*, t. 431.

*Fedia carinata. Carinated Fedia. ♂*

Matthews Del. & Sc.

Pub<sup>d</sup> by W. Baskerville, Botanic Garden, Oxford, 1861.

## FE'DIA\*.

*Linnean Class and Order.* TRIA'NDRIA†, MONOGYNIA.

*Natural Order.* VALERIA'NEÆ, Dec. Fl. Fr. (3rd ed.) v. iv. p. 232.—Lindl. Syn. p. 137; Introd. to Nat. Syst. of Bot. p. 197.—Rich. by Macgilliv. p. 458.—Loud. Hort. Brit. p. 520.—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 665.—Mack. Fl. Hibern. p. 139.—Hook. Brit. Fl. (4th edit.) p. 410.—DIPSACEÆ, Juss. Gen. Pl. p. 194.—Sm. Gram. of Bot. p. 125.—SYRINGALES; subord. ASTEROSEÆ; sect. VALERINÆ; type, VALERIANACEÆ; Burn. Outl. of Bot. pp. 900, 901, 916, & 917.—AGGREGATÆ, Linn.

**GEN. CHAR.** *Calyx* (see fig. 1.) small, upright, unequally toothed, crowning the fruit. *Corolla* (see figs. 1 & 2.) superior, of 1 petal, funnel-shaped, limb in 5 blunt segments; tube gibbous at the base. *Filaments* (see figs. 2 & 3.) 3, sometimes more, inserted in the tube, and rather shorter than the limb. *Anthers* roundish. *Germen* (see fig. 2.) inferior, of 3 cells, roundish and oblong. *Style* (fig. 4.) thread-shaped. *Stigma* notched. *Capsule* (fig. 5.) various in shape, indehiscent, 3-celled, 2 cells abortive, crowned with the teeth of the permanent calyx. *Seeds* (fig. 6.) solitary, smooth.

The small, unequally toothed *calyx*, crowning the fruit; the monopetalous, 5-cleft *corolla*, gibbous at the base; and the indehiscent, 3-celled *capsule*; will distinguish this from other genera in the same class and order.

Six species British.

**FE'DIA CARINA'TA.** Keeled-fruited Fedia. Carinated Corn-salad. Lambs' Lettuce.

**SPEC. CHAR.** Capsule oblong, longitudinally boat-shaped, deeply furrowed in front, keeled at the back; the two sterile cells nearly equal to the fertile one; crowned with the straight single tooth of the calyx. Flowers capitate.

Steven in Mem. Soc. Mosc. vol. v. p. 346.—Roem et Schultes Syst. v. i. p. 361.—Hook. Brit. Fl. (4th ed.) p. 22.—Bab. Prim. Fl. Sarn. p. 48.—*Valerianella carinata*, Lois. Not. p. 149.—De Cand. Prod. v. iv. p. 629.—Lindl. Syn. (2nd edit.) p. 324.—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 670.—Leight. Fl. of Shropsh. p. 27.—*Valerianella, semine umbilicato nudo oblongo, nobis*, Moris. Oxon. sect. 7. t. 16. f. 31.

**LOCALITIES.**—In corn-fields, hedge-banks, and on walls; very rare.—Oxfordshire; On a wall in Rose Lane, Oxford, opposite the Botanic Garden; May 21, 1841.—As this species has been cultivated in the Botanic Garden for these last three years, it may possibly have escaped from thence to the wall on the opposite side of the lane; yet a *Fedia* has grown there for several years, but, till I examined it this season, I had always considered it to be *F. olitoria*, a species which is common about Oxford, but which is not now on the wall in question:

---

\* From *fedus*, an ancient word, synonymous with *haedus*, a *kid*. Don.

† See folio 56, note †.

W. B.—*Essex*; On a garden wall at Marden Ash, a short mile from Ongar, nearly opposite to where the road branches off to Brentwood (Mr. BORRER), very difficult to get at, and I have no doubt escaped from cultivation: W. A. BROMFIELD, in *New Bot. Guide*.—*Shropshire*; Hedge-bank, close to the Long Lane Quarry, near Cheney Longville: W. A. LEIGHTON, B. A. in *Fl. of Shropsh.* Hedge-banks under the quarries near Leigh Hall, one mile from Grimer Rocks: J. E. BOWMAN, Esq. *ibid.* Hedge-bank of a bye-road about a mile from the Craven Arms, eight miles W. of Ludlow: J. E. BOWMAN, in Brit. Fl. 4th edit.—WALES. *Denbighshire*; Between Gresford and Wrexham: *ibid.*—Common on cultivated and waste land in the islands of Jersey; Guernsey; and Alderney: C. C. BABINGTON.

Annual.—Flowers from April to June.

*Root* small, tapering, fibrous. *Stem* from 3 to 15 inches high, dichotomously branched, without distinct flowers in the forks, grooved, and rough with rigid deflexed bristles. *Root-leaves* spatulate; those of the stem oblong, blunt, entire, or slightly toothed, somewhat stem-clasping, their margins clothed with short, rigid, projecting bristles. *Flowers* small, pale-blue, in terminal, compact heads, with a kind of involucrum at their base, formed of numerous, crowded, often divided, oblong *bracteas*, ciliated and membranous at their margins. *Capsule* (see fig. 5.) oblong, somewhat 4-angled, 3-lobed, deeply furrowed in front, keeled on the back, slightly pubescent, 3-celled, equal, two of the cells (see fig. 7.) a little divergent, single-ribbed on each side, and abortive, the fertile one transverse, with a longitudinal rib at the back, and terminated in a short blunt tooth. *Seed* solitary in the fertile cell, oval, smooth. (See *The Flora of Shropshire*).

This species, which is a native in France, Germany, Tauria, Sicily, &c. as well as in Britain, has the habit of *Fedia olitoria*, or common Lambs' Lettuce, to which it is closely allied, but from which it may be readily distinguished by its oblong, boat-shaped capsule, crowned with a single tooth. It may, like *F. olitoria*, be used in salads through the Winter and early Spring, as a substitute for common lettuce, to which it is said to be very little inferior.—The specimen figured was from a wall in Rose Lane, Oxford.

---

The Natural Order VALERIA'NEÆ consists of small, *herbaceous*, *dicotyledonous plants*, with opposite *leaves*, without stipulas. Their *flowers* are either corymbose, panicled, or capitate. The *calyx* is superior, with the limb either toothed or forming a *pappus*. The *corolla* is monopetalous, tubular, and inserted into the top of the *germen*, with from 3 to 6 lobes, either regular or irregular, and sometimes spurred at the base. The *stamens* vary from 1 to 5, they are inserted into the tube of the corolla, and alternate with its lobes. The *ovary* has one perfect cell and often two abortive ones. The *fruit* is dry and indehiscent; and the *seed* solitary and pendulous, with a straight *embryo*, destitute of albumen. The British Genera are *Valeriana*, t. 90; and *Fedia*, t. 432.—It is said, that the seeds of *Valeriana rubra* (t. 90.) have been used in former times for embalming the dead; and that some thus employed in the 12th century, on being removed from the cere-cloth, in the 19th century, and planted, vegetated.

*Orobis tuberosus.**Tuberous Orobis. 21*

Pub'd by W. Baxter, Botanic Garden, Oxford. 1844.

## O'ROBUS\*.

*Linnean Class and Order.* DIADE'LPHIA†, DECA'NDRIA.

*Natural Order.* LEGUMINO'SÆ, Juss. Gen. Pl. p. 345.—Sm. Gram. of Bot. p. 174.—Lindl. Syn. p. 75.; Introd. to Nat. Syst. of Bot. p. 87.—Rich. by Macgilliv. p. 532.—Sm. Engl. Fl. v. iii. p. 259.—Loud. Hort. Brit. p. 509.—Don's Gen. Syst. of Gard. and Bot. v. ii. p. 91.—LEGUMINA'CEÆ, Loudon's Arb. Brit. p. 561.—PAPILIONA'CEÆ †, Linn.—ROSALÆ; sect. CICERINÆ; subsect. LOTIANÆ; type, LATHYRACEÆ; subtype, VICIDÆ; Burn. Outl. of Bot. pp. 614, 638, 642, 659, & 661.

**GEN. CHAR.** *Calyx* (fig. 1.) inferior, cup-shaped, unequal, with 5 acute segments; the two upper shorter and more distant; the lower one longest. *Corolla* (fig. 2.) papilionaceous, of 5 petals; standard (fig. 3.) inversely heart-shaped, reflexed at the sides, rather longer than the rest; wings (fig. 4.) inversely egg-shaped, ascending, approaching each other; keel (fig. 5.) rounded, pointed, rather tumid, of 2 united petals, with separate claws. *Filaments* (fig. 6.) 10, 9 united into a compressed tube, open at the upper edge; the 10th hair-like, and distinct. *Anthers* small, roundish. *Germen* (fig. 7.) oblong, compressed. *Style* (see fig. 7.) ascending, straight, cylindrical, channelled above. *Stigma* longitudinal, linear, downy, running along the inner, or upper, side of the upper half of the style. *Legume* (fig. 8.) oblong, or linear, tumid, or somewhat cylindrical, with a sharp ascending point, of 1 cell, and 2 rigid, twisting valves. *Seeds* (fig. 9.) several, roundish, with a linear hilum.

The cup-shaped, irregularly 5-cleft *calyx*, blunt at the base; the slender, strap-shaped *style*, downy on the upper side, beneath the stigma; the cylindrical, oblong, 1-celled, many-seeded *legume*; and the *leaves* without tendrils; will distinguish this from other genera, with diadelphous stamens, in the same class and order.

Three species British.

O'ROBUS TUBERO'SUS. Tuberous-rooted Orobos. Bitter-Vetch. Heath Pea. Wood Peaseling.

**SPEC. CHAR.** Stem simple, winged, smooth, upright, tuberous at the base. Leaves pinnate; leaflets 2 or 3 pairs, elliptic-spear-shaped, smooth. Stipulas half-arrow-shaped; toothed at the base. Peduncles few-flowered, scarcely longer than the leaves.

II. p. 11. t. 1.

LOCALITIES.—In mountainous pastures, thickets, and woods; frequent.

Perennial.—Flowers in May and June.

*Root* somewhat creeping, externally blackish, with oblong tubers. *Stem* about a foot high, sometimes decumbent, but usually upright, simple, slender, smooth, leafy, with 3 or 4 angles, the two opposite angles winged. *Leaves* alternate, winged, their common foot-stalk (petiole) projecting beyond the leaflets into a bristle-shaped appendage; *leaflets* from 2 to 3 pairs, elliptic-oblong, opposite, sessile, entire, smooth, with a sharp point, and 3 longitudinal ribs. *Stipulas* half-arrow-shaped, usually more or less toothed at the base, sometimes entire. *Peduncles* axillary, about as long as the leaves, few-flowered; each flower on a short, slender pedicel. *Calyx* (fig. 1.) tubular, smooth, purplish, blunt at the base, irregularly 5-toothed, lower tooth the longest, two upper teeth shortest. *Corolla* (fig. 2.) elegantly variegated and veined, with purple, crimson, and shades of blue and flesh-colour, changing to blue as it fades. *Legume* (fig. 8.) pendulous, long, cylindrical, black when ripe. *Seeds* globose, a little compressed, of a yellowish-brown colour. It sometimes varies with narrow strap-shaped leaflets, and it then constitutes *Orobus angustifolius* of ROTH'S *Tentamen Floræ Germanicæ*, v. i. p. 305; and of D. DON, in *The Memoirs of the Wernerian Natural History Society*, v. iii. p. 301.

This species of *Orobus* is a native of almost every part of Europe, in woods, and among bushes. In the Highlands of Scotland it is called *Corr* or *Cor-Meille*, and the Highlanders have a great esteem for the tubercles of the roots (see fig. 10), which they dry and chew, as our people do tobacco, to give a better relish to their liquor. They also affirm them to be good against most disorders of the chest, and that by the use of them they are enabled to repel hunger and thirst for a long time. In Breadalbane and Ross-shire they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are savoury and nutritious; ground to powder they may be made into bread. In Holland and Flanders they are roasted and eaten in the same manner as chesnuts. This plant is supposed to be the *Chara* named in CÆSAR'S *Commentaries*, De Bell. Cib. iii. 40., the root of which, steeped in milk, was such a relief to the famished army at the siege of Dyrachium. It is also believed to have been the Caledonian food described by DIO, on which, mixed with milk, the soldiers of VALERIUS' army subsisted under a penury of bread.

Horses, cows, goats, and sheep, will eat the plant.—The tubers of *Lathyrus tuberosus* (Bot. Mag. t. 111.), an exotic plant, are said to possess the same properties as those of the *Orobus*, and instructions for the cultivation of them may be seen in the 2nd volume of the *Transactions of the Horticultural Society of London*, p. 359.; and in Mr. LOUDON'S *Encyclopædia of Gardening*, (new edit.) p. 882. paragr. 4708.

#### A Shrub.—Flowers in February and March.

Stem 3 or 4 feet high, with long, slender branches, spreading widely, and, if not supported, trailing on the ground, very smooth, of a rich and shining purple, with a somewhat glaucous hue. Leaves partly opposite, partly alternate, on short, smooth petioles, without stipulas, spear-shaped, broadest above the middle, tapering below, slightly serrated, smooth, of a glaucous green, especially on the under side. The catkins appear earlier than the leaves, and often on different branches; they are about an inch long, cylindrical, and bluntish; their scales inversely egg-shaped, hairy, and black in their upper half. Nectary a single gland opposite to each scale. Filament always solitary, simple, smooth, and about twice the length of the scale. Anther tawny, of 4 lobes, and as many cells. Germen (fig. 4.) sessile, small, broadly elliptical, silky, rather longer than its scale, which is shorter than that of the sterile flower (fig. 2). Style scarcely any till after flowering, when it is slightly protruded. Stigmas egg-shaped, thick, blunt, permanent. Capsules (figs. 5 & 6.) hoary, densely downy. (*Sm. Engl. Fl.*)

This, according to Sir J. E. SMITH, is a very valuable Osier for fine basket-work, but more especially for plating into low close fences, to keep out hares and rabbits, the leaves and bark being so intensely bitter, that those animals will not touch either. The twigs are so long, tough, and flexible, that they may be interwoven into any shape; and a fence of this kind is scarcely inferior to one made of wire.

---

The *Natural Order SALICINEÆ* is composed of dicotyledonous trees or shrubs, whose leaves are alternate, simple, and furnished with deciduous or persistent *stipulae*. The flowers are separated, and are either monoecious, or dioecious; and collected into cylindrical or egg-shaped catkins. The sterile flowers are composed of from 1 to 20 stamens, placed in the axilla of a scale-like *calyx* (*bractea* of some authors), or upon its upper surface. The fertile flowers consist of a fusiform germen, with a simple style, terminated by two, notched or 2-parted, *stigmas*, situated in the axilla of a scale-like *calyx*. The fruit is coriaceous, 1- or 2-celled, containing many seeds surrounded by long silky hairs, and opening by two valves. The embryo is erect, and the radicle inferior.—The bark of the *Salicineæ* is generally astringent and tonic. It is employed in tanning; and that of some species, especially of *Salix purpurea*, *S. Helix*, and *S. Russelliana*, has acquired celebrity as a substitute for Peruvian bark in fevers. The only British genera in this order are *Salix* and *Populus*.

LOCALITIES.—In grassy pastures, on heaths, and in woods, especially on a gravelly soil; common.

Perennial.—Flowers in May and June.

*Root* a solitary, globose, or somewhat irregularly-shaped, tuber; of a chestnut-colour outside, white within, solid, producing from the sides and lower part a few slender fibres. *Stem* from one to two feet high, solitary, upright, roundish, striated, smooth; tapering, zigzag, and whitish at the base, to a greater or less extent under ground; sometimes, though rarely, it is straight and short in that part, when the root happens to be very shallow in the ground. *Leaves* with long, very narrow, pointed, entire segments; those from the root twice or thrice pinnatifid, on long, slender *foot-stalks*, tapering and zigzag under ground; those on the stem twice or thrice ternate, scattered, nearly sessile, clasping the stem with their smooth, striated sheath, which is membranous and whitish at the margins. *Umbels* several, terminal, drooping before the flowers open, afterwards upright; of 7, or more, smooth, slender, straight, stiff rays; those of the *partial umbels* still more numerous. *General Involucrum* of from 1 to 3 leaves, often entirely wanting; *partial one* of several leaves. *Flowers* white, all regular, or very nearly so, and all perfect, though some of the central ones bear no seed. *Calyx* mostly wanting, or obsolete; sometimes of 2 or 3 short, sharp, spreading, permanent teeth. *Fruit* oblong, moderately ribbed, a little narrower upwards, and terminated with the straight *styles*, which have conical, very tumid, bases.

The roots of this plant are aromatic, sweet, and mucilaginous, with some aerymony. They are frequently dug up and eaten by children. SHAKSPEARE, in his "Tempest," makes CALIBAN say—

"I pr'ythee, let me bring thee where crabs grow;  
And I with my long nails will dig thee *pig-nuts*;  
Shew thee a jay's nest, and instruct thee how  
To snare the nimble marmozet," &c.

Swine are very fond of these roots, and will soon become fat with feeding on them; and it is to procure these roots that pigs root up the earth in pastures, &c.

RAY, in "The Wisdom of GOD manifested in the Works of the Creation," says, "I have myself observed, that in pastures where there are earth-nuts to be found up and down in several patches, tho' the roots lie deep in the ground, and the stalks be dead long before and quite gone, the swine will by their scent easily find them out, and root only in those places where they grow." This is, as DR. WITHERING observes, "a singular and instructive example of the instinct with which the Creator has provided animals, in order to supply their wants."—When boiled, these roots are very pleasant and delicious, and are supposed to afford great nourishment. Thus prepared, they are said to be eaten in Holland and the Alps, and in some parts of England in soup or broth. Roasted they are even superior to chestnuts. In Sweden they are an article of commerce.

The true *Bunium bulbocodium* is a very different plant from ours, and has never been found wild in Britain.

436

*Eleocharis palustris*. Marsh spike-rush. 24

Mather & Tolles

Pubd by W. D. Brewster, Botanic Garden, Oxford, 1861.

## ELEO'CHARIS\*.

*Linnean Class and Order.* TRIA'NDRIA†, MONOGY'NIA.

*Natural Order.* CYPERA'CEÆ, Juss.—Lindl. Syn. p. 278.; Introd. to Nat. Syst. of Bot. p. 304.—Rich. by Macgilliv. p. 392.—Loud. Hort. Brit. p. 541.—Mack. Fl. Hibern. p. 318.—Hook. Brit. Fl. **GEN. CHAR.** Spike terminal, solitary, naked; of numerous flowers, all perfect. *Glumes* (see fig. 1.) imbricated in every direction, expanded, uniform. *Corolla* none. *Filaments* (see fig. 1.) 3, hair-like. *Anthers* (see fig. 1.) strap-shaped. *Germen* (see fig. 2.) compressed. *Style* (see figs. 2 & 3.) dilated, or bulbous, at the base, and united by a suddenly contracted joint, with the germen. *Stigmas* 2 or 3. *Fruit* (see fig. 4.) compressed, bluntly 3-cornered, crowned with the permanent bulbous base of the style. *Bristles* (*perianth* of BROWN) (see fig. 1 to 4.) from 2 to 10, finely toothed, beneath the germen, rarely wanting.

The simple, solitary, naked, many-flowered spike; the 1-valved glumes, imbricated on all sides; the perianth of from 2 to 10 rough bristles; and the lenticular, or bluntly 3-cornered seed, crowned with the hardened, dilated base of the style; will distinguish this from other genera, with inferior, glumaceous flowers, in the same class and order.

Six species British.

ELEO'CHARIS PALU'STRIS. Marsh Spike-rush. Creeping Spike-rush. Marsh Club-rush.

**SPEC. CHAR.** Root creeping. Stem rounded. Stigmas two. Fruit roundish-obovate, most convex on one side, shorter than the four bristles. Outer glume smaller than the rest.

Fig. 1. A single Flower.—Fig. 2. Germen, Style, and Stigmas, and hypogynous Bristles.—Fig. 3. Same farther matured.—Fig. 5. Fruit, crowned with the bulbous base of the style, and accompanied by the bristles at the base.—All more or less magnified.

\* From *elos*, Gr. a marsh; and *charo*, Gr. to delight; from its place of growth.

† See folio 56, note †.

LOCALITIES.—Sides of ditches, marshy places, and wet meadows ; common.

Perennial.—Flowers in June and July.

*Root* creeping, black, shining, and sending out, at intervals, slender, branching fibres. *Culms* many together, from 6 inches to a foot high, upright, nearly cylindrical, smooth and shining, without any central pith, and consisting of large membranous tubes, surrounded by smaller ones, each invested at the base with 2 or 3 tight, entire, cylindrical, reddish, shining sheaths. *Leaves* none. *Spike* egg-shaped or oblong, pointed, about half an inch long. *Glumes* (see fig. 1.) brown, bluntly keeled, egg-shaped, acute, with a membranous border. *Stamens* (see fig. 1.) 3, hair-like. *Anthers* (see fig. 1.) strap-shaped, pale yellow, loosely spreading. *Bristles* 4, occasionally 5 or 6, longer than the germen, and clothed with deflexed teeth, except at the base, which is slightly dilated. *Germen* (see fig. 2.) egg-shaped. *Style* (see fig. 2) 1, dilated and bulbous at the base (see figs. 2 & 3.), but its point of attachment with the germen contracted. *Stigmas* (see fig. 2.) only 2, downy, spreading, as long as the style. *Fruit* (see fig. 4.) brown and shining, inversely egg-shaped, tumid at each side, but most so on that next the glume ; crowned with the brown, wrinkled, compressed, permanent, unpolished base of the style, and subtended by from 4 to 6 bristles, about its own length.

Goats and horses are said to eat this plant ; cows and sheep to refuse it. Swine devour the roots greedily when fresh, (for which purpose they are collected by the Swedish peasants), but will not touch them when dry.

---

The *Natural Order CYPERACEÆ* is composed of glumaceous, monocotyledonous, herbaceous *plants*, which generally grow in moist places, and on the margins of lakes and streams. Their *stems* are 3-cornered or cylindrical, with or without joints. Their *leaves* are sheathing, and their *sheaths* entire and not slit. The *flowers* are perfect or divided, consisting of imbricated solitary bractææ (see fig. 1.), very rarely enclosing other bractææ called *glumes*. The *stamens* are situated below the germen, and are definite, as 1, 2, 3, 4, 5, 6, 7, 10, or 12 ; but generally 3. The *anthers* are fixed by their base, and are entire and 2-celled. The *ovary* is 1-seeded, and often surrounded by bristles called *Hypogynous Setæ* ; these bristles have been considered, by some authors, as the true *perianth*, and styled *perigynium*. The *ovule* is erect ; the *style* single, generally trifid, rarely bifid ; the *stigmas* entire ; and the *fruit* (*nut* of LINDLEY, *achenium* of HOOKER) crustaceous or bony ; with the *embryo* enclosed in the base of a copious *albumen*.

The *Cyperaceæ* are of little importance as affording food or medicine to man. The roots of *Cyperus longus* are said to be tonic. The celebrated *Papyrus antiquorum*, from which the chief of the paper used by the ancients was procured, belongs to this *natural order*.

The British genera are, 1. *Cyperus* ; 2. *Cladium* ; 3. *Schænus*, t. 268. ; 4. *Rhynchospora*, t. 396 ; 5. *Scirpus*, t. 264 ; 6. *Blysmus*, t. 308. ; 7. *Eleocharis*, t. 436. ; 8. *Eriophorum*, t. 427. ; 9. *Elyna* ; and 10. *Carex*.

*Actinocarpus Damasonium. Common Star-fruit.* II

B. G.—*Sussex*; Pits on St. John's, Chailey, and Broadmere Commons; and at Henfield: N. B. G. Between Sheffield Arms and Horsted Keynes: Mr. E. JENNER.

#### Perennial.—Flowers in June and July.

*Root* of many long pale fibres. *Leaves* all radical, floating, oblong, bluntnish, somewhat heart-shaped at the base, 5-nerved, quite entire, smooth and glossy, like every other part of the plant. *Petioles (leaf-stalks)* long, almost semicylindrical, broad and membranous at the base, tapering upwards. *Scape (flower-stalk.)* from 6 inches to a foot high, bearing 1 or 2 whorls of flowers. *Petals* white, very delicate, inversely heart-shaped, each having a yellow spot at the base. *Capsules* (fig. 5.) 6, spreading in the form of a star, awl-shaped, compressed, 1- or 2-seeded, closely combined at the base, so as to appear like a single fruit. *Seeds* (figs. 7 & 8.) oblong, tuberculated and transversely striated, compressed, with a deep furrow on each side, occasioned by the form of the embryo within, which is cylindrical and bent double, somewhat like a horse-shoe (fig. 9).

This plant is a native of France and Siberia, as well as of England; it is subject to much variation in size, according to the depth of water in which it grows.—The specimen figured was sent to me by my very kind friend Mr. E. JENNER, of Lewes, to whom I am indebted for several other rare plants.

Poterium Sanguisorba. Common Salad-Burnet. II

† See folio 93, note †.      ‡ See folio 53, note ‡.      § See folio 313, a.

LOCALITIES.—On hilly pastures, &c. in a dry calcareous soil; frequent.

Perennial.—Flowers from April to July.

*Root* woody, whitish, penetrating deep into the earth. *Stems* from 6 inches to a foot high, or more, upright, angular, smooth, often of a reddish colour, branched, herbaceous, leafy, many-flowered. *Leaves* pinnate, of several pairs of roundish, or egg-shaped, deeply serrated, veiny leaflets, with an odd one, all of a deep, somewhat glaucous, green, smooth, but not shining, the nerves on the under side hairy. *Stipulas* joined to the base of the leafstalks in pairs, sharply cut. *Flowers* dull purple, in little globose heads, the uppermost *fertile*, the lower *sterile*, or sometimes perfect. *Filaments* very long, and often red. *Styles* hair-like, and terminated by the tufted stigma, which is bright crimson, and very elegant. *Fruit* (tube of the corolla) 4-cornered, wrinkled.

The leaves taste and smell like cucumber, and give that flavour to salads, for which purpose the young leaves are sometimes used. They are also occasionally put into soups, and they form a favourite herb for cool tankards. It has been sometimes cultivated in an agricultural point of view, especially on a calcareous soil, and it is stated to prove an excellent winter pasture, when hardly any thing else vegetates. The severest frost never injures this plant, and the oftener it is fed the thicker are its leaves, which spring constantly from its root, and their flat circular spread will prevent the growth of weeds. A species of *Coccus* may be found about the roots of Burnet, which was formerly used for dyeing silk and wool a rose colour. In Britain it is superseded by the Mexican Cochineal, but the Moors are said still to make use of it.

It is remarked by Mr. KNAPP, in his delightful book, "The Journal of a Naturalist," that this plant possesses, in a remarkable degree, the faculty of preserving its verdure, and flourishing amid surrounding aridity and exhaustion. "It is probable," continues Mr. KNAPP, "that this plant, and some others, have the power of imbibing that insensible moisture, which arises from the earth even in the driest weather, or from the air which passes over them. The immense evaporation proceeding from the earth, even in the hottest season, supplies the air constantly with moisture; and as every square foot of this element can sustain eleven grains of water, an abundant provision is made for every demand. We can do little more than note these facts: to attempt to reason upon the causes, why particular plants are endowed with peculiar faculties, would be mere idleness; yet, in remarking this, we cannot pass over the conviction, that the continual escape of moisture from one body, and its imbibition by another, this unremitting motion and circulation of matter, are parts of that wonderful ordination, whereby the beneficence and wisdom of Providence are manifested: without the agency of evaporation, not dwelling on the infinitude of effects and results, no vegetation could exist, no animal life continue."

**LOCALITIES.**—In dry sandy fields, and on gravelly banks; frequent.

Fig. 1. Back view of a Flower.—Fig. 2. Front view of ditto.—Fig. 3. Germen, covered by the tube of the Calyx.—Fig. 4. A Seed.—All magnified.

\* From *skleros*, Gr. hard; and *anthos*, Gr. a flower; from the indurated nature of the floral covering.

† See folio 37, note †.

**Annual.—Flowers in July and August.**

**Root** small, tapering, fibrous. **Stems** numerous, straggling, slender, from 3 to 6 inches long, decumbent, round, leafy, dichotomously branched, pale green, sometimes reddish, downy chiefly on opposite sides. **Leaves** strap-shaped, pointed, keeled, entire, opposite, and combined at the base by a membranous ciliated margin. **Flowers** small and inconspicuous, of a pale green colour, nearly sessile, partly axillary, partly collected into dense forked tufts. Tube of the *Calyx* (see figs. 1 & 2.) egg-shaped, with 10 ribs, and as many furrows; limb in 5, egg-spear-shaped, pointed segments, white and membranous at the edges, spreading when in flower, upright when in fruit. **Stamens** shorter than the calyx, sometimes 10, but frequently only from 5 to 8, some being often short and imperfect. **Styles** spreading. **Stigmas** downy. **Capsule** inclosed in the permanent, hardened calyx.

This plant is not uncommon on a sandy soil, especially in fallow fields, and in most parts of Europe and Siberia. It was formerly collected in large quantities for dyeing red in the Ukraine, Lithuania, &c., and is still employed by the Turks and Armenians for dyeing wool, silk, and hair, as also for staining the nails of women's fingers. In Europe its use is generally superseded by the true Cochineal, (*Coccus Cacti*), which has been cultivated in the Intendency of Oaxaca, Mexico, several centuries, and of which, according to Dr. BANCROFT, 375,000*l.* worth are annually consumed in Britain. The Swedes and Germans receive the vapours arising from a decoction of this species into their mouths to cure the tooth-ache.

Goats and sheep eat the plant ; cows refuse it.

The Polish scarlet grain or cochineal, (*Coccus Polonicus*), is found upon the roots of this and the other British species (*Scleranthus perennis*), in the Summer months. **WITHERING.**—Some authors consider *S. perennis* as not differing specifically from *S. annuus*.

---

The *Natural Order SCLERANTHEÆ* consists of apetalous, dicotyledonous, small *herbaceous plants*, with opposite *leaves*, without stipulas. Their *flowers* are hermaphrodite, axillary, and sessile. The *calyx* (see fig. 1.) is 4- or 5-toothed, with a urceolate (pitcher-shaped) tube, into the orifice of which the *stamens*, from 1 to 10, are inserted. The *ovarium* is simple, superior, and 1-seeded ; with 2 *styles*, or, sometimes, only 1, their apex emarginate. The *fruit* is a membranous utricle enclosed within the hardened calyx. The *seed* is pendulous from the apex of a funiculus\*, which arises from the bottom of the cell ; and the *embryo* is cylindrical, and curved round farinaceous albumen.

---

\* A little stalk, by which the seed is attached to the placenta.

LOCALITIES.—In moist meadows, pastures, heaths, and woods; common.

*Root* creeping, sheathed with purplish-brown scales. *Culms* (*stems*) upright, from eight inches to about a foot high, triangular, sea-green, scarcely rough in any part. *Leaves* chiefly from the root, partially recurved, broadish, pointed, very glaucous, especially on the underside, rough on the keel and the edges, not half so tall as the culms, much resembling the foliage of pinks or carnations. *Bracteas* leafy, the lowermost several inches long; their sheaths very short, or scarcely any, crowned with rounded brown auricles. *Sterile Catkins* generally solitary, sometimes accompanied by a smaller one, and the upper portion of the upper fertile catkins frequently consists of sterile florets. *Fertile Catkins* 2, often 3, cylindrical, blunt, many-flowered, very dense, drooping as they ripen, and at length pendulous, each on a slender, smooth *stalk*, many times longer than its *sheath*. *Scales* egg-shaped, more or less acute; chocolate-coloured, with a greenish rib. *Scales* of the *Sterile Catkins* usually inversely egg-shaped and blunt, dark brown, with a yellow rib; sometimes they are partly acute, and even pointed. *Stamens* 3, (see fig. 3). *Stigmas* 3, on a short style, (see fig. 4). *Perigynium* (*Corolla* of SMITH) brownish when ripe, and then termed *fruit*, (see fig. 5), enclosing the seed, elliptical, or somewhat inversely egg-shaped, obtuse, bluntly triangular, tumid, minutely dotted or tuberculated, and with minute short bristly hairs or pubescence. *Seed* (figs. 6 & 7.) short, triangular, dark brown, with pale angles.

Varieties occur in which the sheath of the lower fertile catkin is more elongated, and the peduncle very long; the sterile catkin either solitary, and the fertile catkins entirely fertile; or, with four completely sterile catkins, with half another; though only one, compound at the base, consisting entirely of fertile *florets*. This last variety is *Carex Micheliana* of SMITH, in *Trans. of Linnean Society*, vol. v. p. 270., *Fl. Brit.* v. iii. p. 1004.; and *Engl. Bot.* t. 2236. It has smooth fruit. See *Engl. Fl.* and *Leight. Fl. of Shropshire*.

**GEN. CHAR.** *Flowers* spathaceous. *Sterile Flower* (see fig. 1). *Calyx* (fig. 3.) in 3 deep, equal, oblong, concave segments, membranous at the edges. *Corolla* (see fig. 1.) of 3, roundish, undulated petals, much larger than the calyx, and alternate with its segments. *Filaments* (see fig. 6.) 9, awl-shaped, upright, in three rows; the intermediate row producing, from its base internally, an awl-shaped stalk, or beak (see figs. 4 & 6.), resembling a style, stationed in the centre of the flower; the two other rows connected at the base, and adhering to the beak (see fig. 5). *Anthers* 2-lobed, below the pointed summit of each filament. *Fertile Flower* (see fig. 2). *Calyx* and *Corolla* as in the sterile flower. *Germen* (see fig. 8.) inferior, roundish. *Styles* (see fig. 8.) 6, as long as the calyx, compressed, channelled. *Stigmas* cloven, acute: *Capsule* nearly globular, leathery, of 6 cells. *Seeds* numerous, roundish, minute.

The beaked *filaments* of the inner *stamens* of the *sterile flower*; the 6 *styles*; the inferior, 6-celled, many-seeded capsule of the *fertile flower*; and the 3-cleft calyx, and 3-petalled corolla of both flowers; will distinguish this from other genera in the same class and order.

One species British.

**HYDRO'CHARIS MO'RSUS RA'NÆ.** Common Frog-bit.  
Lesser Water-lily.

**SPEC. CHAR.**

Arr. v. ii. p. 220.—*Stratiotes foliis Asari, semine rotundo*, Ray's Syn. p. 290.—*Morsus Ranae*, Johnson's Gerarde, p. 818.

**LOCALITIES.**—In watery ditches, ponds, and slow streams; frequent in England; more rare in Scotland.

Fig. 1. Sterile Flower.—Fig. 2. Fertile Flower.—Fig. 3. Calyx.—Fig. 4. A separate Stamen.—Fig. 5. Ditto.—Fig. 6. Stamens.—Fig. 7. Rudiment of a Germen in the Sterile Flower.—Fig. 8. Germen of Fertile Flower.

\* From *udor*, Gr. water; and *charo*, Gr. to rejoice; from the beauty of its leaves and flowers embellishing the waters.

† See folio 143, note †.

‡ See folio 34, note †.

Perennial.—Flowers in July.

*Root* of many long, perpendicular, thread-shaped fibres, furnished towards the end with numerous radicles. *Leaves* mostly floating, roundish kidney-shaped, about an inch and a half broad, fleshy, smooth, very entire, somewhat transparent, with a few circular, and many transverse veins; purplish underneath. *Petioles (leaf-stalks)* from 3 to 6 inches long, cylindrical, smooth, thick, transparent, marked with transverse reticulations. *Sterile Flowers* (fig. 1.) 3, on long peduncles arising from a 2-leaved, transparent, membranous *spatha*. *Fertile Flowers* (fig. 2.) on a solitary peduncle, arising from a single *spatha*. Segments of the *Calyx* equal, between egg-shaped and oblong. *Petals* much larger, roundish, undulate, very delicate, white, with a yellow stain at the base of each. *Stamens* sometimes more than 9, as many as 12. *Seeds* small, egg-shaped, attenuated at the base, with a lax somewhat fleshy covering, formed of warts consisting of spiral cellules.

This is a highly ornamental water plant, which will grow freely in ponds and ditches, and is deserving of more frequent introduction into aquaria. It is a native of many parts of Europe in deep ditches, and slow streams, with a muddy bottom, multiplying itself greatly by runners which shoot out to a great length, and put out at the joints long roots which penetrate deep into the mud.

Mr. CURTIS observes, that the whole structure and economy of the *Frog-bit* is exceedingly curious, deserving the minute attention of the inquisitive Botanist.

RAY mentions a double-flowered, very sweet-scented, variety, as growing in his time plentifully in a ditch by the side of Audrey Causeway, in the Isle of Ely, near the great wooden bridge; but Mr. RELHAN sought it there in vain.

---

The *Natural Order HYDROCHARIDÆ*, to which the present plant belongs, is composed of monocotyledonous herbaceous floating *plants*, whose *leaves* are mostly radical, with parallel veins, sometimes spiny. Their *flowers* are spathaceous, and either perfect, or separated, with a 3-parted, herbaceous *calyx*, and a *corolla* of 3 petaloid petals. The *stamens* are either definite or indefinite. The *ovary* is single and inferior; with from 3 to 6 *stigmas*. The *fruit* is either dry or succulent, indehiscent, with one or more cells. The *seeds* are destitute of albumen; and have a straight, undivided *embryo*.

The only British genera in this order, are *Stratiotes*, t. 413; and *Hydrocharis*, t. 441.

**LOCALITIES.**—In ponds and watery places; very rare.—*Hampshire*; Abundant in a bog on Petersfield Heath; recently discovered there by Miss RICKMAN, and J. BARTON, Esq.—*Sussex*; In an old gravel-pit, near Buxstead: 1827; W. BORRER, Esq.—*Island of Jersey*; St. Peter's Marsh: MESSRS. HASLAM and W. CHRISTY, 1837.

Fig. 1. A Flower.—Fig. 2. A separate Stamen.—Fig. 3. Germen.—Fig. 4. Capsule.—Fig. 5. Transverse section of Capsule.—Fig. 6. Seed.—Figs. 1 to 5, more or less magnified.

\* So named by LINNEUS, in memory of M. ANTOINE DANTE ISNARD, a Botanist and Professor at Paris, and a Member of the Academy of Sciences; he published descriptions of some plants in their Memoirs for 1716, &c.

† See folio 46, note †.

*Herb* floating, smooth, with numerous, long, thread-shaped *roots*. *Stems* several, procumbent, from 6 to 10 inches or more long, simple, or slightly branched, putting out roots from the lower joints, bluntly 4-angled, smooth, leafy. *Leaves* opposite, on short petioles, egg-shaped, somewhat tapering at the base and forming a slight margin to the petiole, quite entire, smooth, rather succulent, bright green, with the mid-rib and margin often red or purplish. *Flowers* in the axils of the leaves, solitary, sessile, small, greenish and inconspicuous, each accompanied at its base by two small, pointed *bracteas*. *Calyx* with 4 triangular segments. *Corolla* wanting.

*Isnardia palustris* has very much the habit of *Peplis portula*, t. 220.; it is a native of Europe, Siberia, and Persia, where it grows in marshes and slow-running water. It was first added to the British Flora by W. BORRER, Esq. who found it growing in a pool at Buxstead, Sussex, in 1827. Specimens of this very interesting plant have often been kindly communicated to me by Mr. BORRER; but the specimen from which the drawing for the accompanying plate was made, was sent to me in August last (1841), by my kind friend Mr. EDWARD JENNER, of Lewes, Sussex, a most indefatigable Botanist.

A variety with the leaves more acuminate at both ends, is found in North America.

Sixteen species of *Isnardia* are described in DE CANDOLLE'S *Prodromus Systematis Naturalis Regni Vegetabilis*; and in DON'S *General System of Gardening and Botany*; most of which are separated from the old genus *Ludwigia*.

---

The *Natural Order ONAGRARIAE*, is composed of dicotyledonous *herbs* or *shrubs*; with opposite or alternate, simple, entire, or toothed *leaves*; and red, purple, white, blue, or yellow *flowers*, which are either axillary, or disposed in terminal spikes or racemes. The *calyx* is superior, tubular, with a 4- or 5-lobed limb; the lobes cohering in various degrees, with a valvate aestivation. The *petals* are generally equal in number to the lobes of the calyx, into the throat of which they are inserted, mostly regular, with a twisted aestivation, rarely wanting. The *stamens* are sometimes equal in number to the petals, but usually twice that number; with distinct *filaments*, and oblong or egg-shaped *anthers*. The *ovary* is many-celled, usually crowned by a cup-shaped gland; with a thread-shaped *style*, and a capitate or lobed *sigma*. The *fruit* is a *berry* or *capsule*, with from 2 to 4 cells. The *seeds* are numerous, without albumen; and have a straight *embryo*; a long and taper *radicle*; and very short *cotyledons*.

The British Genera of this order, are *Epilobium*, t. 14.; *Oenothera*, t. 257.; *Circæa*, t. 9.; and *Isnardia*, t. 442. The properties of *Onagrariae* are few, or unknown. *Oenothera biennis*, t. 257, is sometimes cultivated for the sake of its eatable roots, as a sort of salad.

LOCALITIES.—On banks and waste ground; very rare.—*Oxfordshire*; Under the hedge on the north side of the Parks: Dr. SIRTHORP; 1794. It grew there up to 1819, and also under the trees on the west side of the Parks, but it has since disappeared from both these stations. It grew also on a bank beyond Jericho, about a quarter of a mile N. W. of the Observatory, where it was first pointed out to me by the late Mr. H. HINTON, about 1814, but that locality is now built on: W. B.—*Bucks*; Hedges near Eton-wick, in the greatest abundance: Mr. GOTOBED.—*Herts*; In a hedge about half a mile from Eton: Mr. GOTOBED; 1803.—*Middlesex*; About London: MORISON.

Annual.—Flowers in June and July.

*Root* tapering, with many slender, almost horizontal, slightly branched fibres. *Stem* from 2 to 4 feet high, upright, branched, leafy, hollow, somewhat flexuose, furrowed, rough with small bristly hairs, which point downwards. *Leaves* unequally pinnate, of a darker green than the stem, clothed with fine, close, bristly hairs, all directed towards the point; leaflets of the lowermost leaves egg-shaped; of the rest spear-shaped, narrow; all coarsely serrated, and sometimes deeply notched, single-ribbed, veiny; the odd one largest. *Petioles* somewhat dilated at the lower part, often hairy. *Umbels* rather small, dense, bristly. *Partial Umbels* about nine. *General Involucrum* of about five slender, strap-shaped, bristly, spreading leaves, shorter than the umbel; *partial involucrum* of 5 awl-shaped leaves, as long as the umbellule, the two inner leaflets smaller. Teeth of the *Calyx* very unequal. *Flowers* white or rose-coloured, more or less radiant, the outermost petal with equal lobes, the two next with very unequal ones. *Fruit* (see fig. 4.) nearly circular; externally bristly; the disk a little convex, marked with 4 brown longitudinal lines; the *border* pale, tumid, wrinkled, and beset with direct bristles; the inside of each *carpel*, with the border, quite smooth, with 2 close, parallel, brown lines, in the middle (see fig. 5). *Channels* with only one *vitta* in each.

The specimen from which the drawing was made for the accompanying plate, was raised in the Oxford Garden in 1840, from seeds kindly communicated to me by Mr. W. PAMPLIN, jun. of Soho Square, London.

444

Gastridium lendigerum. - tumid Nut-grass. ♂  
Mathews Del. & Sc.

Publ'd by W. Beeson Botanic Garden Oxford 1811

## GASTRIDIUM\*.

*Linnean Class and Order.* TRIANDRIA †, DIGYNIA.

*Natural Order.* GRAMINEAE, Juss. Gen. Pl. p. 28.—Sm. Gram. of Bot. p. 86.; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293.; Introd. to Nat. Syst. of Bot. p. 292.—Rich. by Macgilliv. p. 393.—Loud. Hort. Brit. p. 542.—Mack. Fl. Hibern. p. 294.—Hook. Brit. Fl. (4th ed.) p. 426.—GRAMINA, Linn. GRAMINALES; sect. FESTUCINAE; type, PHALARIDACEAE; Burn. Outl. of Bot. v. i. pp. 359 & 369.

**GEN. CHAR.** *Inflorescence* panicled; panicle contracted, spike-like. *Spikelets* (fig. 1.) single-flowered. *Calyx* (fig. 1.) of two nearly equal, concave, keeled, pointed, membranous, awnless glumes, ventricose at the base, much longer than the paleæ. *Corolla* (fig. 3.) of 2 equal, membranous *paleæ*; the lower usually awned under the apex. Sometimes there is a rudiment of a second floret at the back of the upper palea. *Filaments* (see figs. 1 and 3.) 3, hair-like, not longer than the calyx. *Germen* (fig. 4.) egg-shaped. *Styles* (see fig. 4.) 2, pencil-shaped. *Seed* (fig. 5.) egg-shaped, coated with the hardened corolla.

The contracted, spike-like *panicle*; the single-flowered *spikelets*; the *calyx* of 2 nearly equal, awnless, ventricose glumes, much longer than the corolla; and the *corolla* of 2, equal, membranous paleæ, investing the seed, the lower one mostly with a dorsal awn; will distinguish this from other genera in the same class and order.

One species British.

**GASTRIDIUM LENDIGERUM.** Awned Nit-grass. Panick Millet-grass. Lentil-grass. Yellow-spiked Millet-grass. Yellow Bent.

**SPEC. CHAR.** Flowers in a dense spiked panicle. Corolla awned. Awn much longer than the calyx.

In a corn-field in the way from the High Rocks, Tunbridge Wells, to Eridge Rocks: T. FORSTER, Esq. In a corn-field (had been wheat) at Westfield, in great abundance; Sept. 16, 1841: Mr. EDWARD JENNER, of Lewes, Sussex. Groombridge, and other places about Hastings: N. J. WINCH, Esq.—**Warwickshire**; In a corn-field near Alcester: Rev. A. BLOXAM.—**Wales**. Denbighshire; Pastures east of Merlin Farm House, in the parish of Llanyfyllt: Mr. GRIFFITH.—**Flintshire**; About Trelewelin Farm, in the parish of Rhyddlan: Mr. GRIFFITH.

#### Annual.—Flowers in August.

*Root* of many short, slender fibres. *Culm (stem)* upright, from 6 inches to a foot or a foot and a half high, branched from the bottom, smooth, leafy. *Leaves* rough at the edges, with roughish, striated, slightly tumid sheaths. *Stipula (ligula)* oblong, torn when old. *Panicle* upright, lobed, but very close, tapering, from an inch and a half to three inches and a half long, and a quarter of an inch to half an inch broad, pale green, glossy; with roughish and angular partial stalks. *Flowers* small, pale green. *Calyx* tumid polished and colourless at the base; its glumes compressed, membranous at the edges, rough at the keel (see figs. 1 & 2); one of them longest, and most pointed, but not awned. *Corolla* (see fig. 3.) much smaller; its outer palea egg-shaped, concave, blunt, downy, with a jointed, rough, twisting, dorsal *awn*, rather longer than the calyx, deciduous; inner palea smaller, cloven, hairy at the base. *Anthers* short. *Seed* coated with the hardened corolla, and enveloped in the shining calyx.

As well as of England it is also a native of Portugal, and the south of France.

I am indebted to the kindness of Dr. W. A. BROMFIELD, of Ryde, Isle of Wight, for many very fine specimens of this grass, from one of which the drawing for the accompanying plate was made; they were gathered, by Dr. BROMFIELD, between Quarr Abbey and Fishbourne, near Ryde, in a field abounding also with the rare *Briza minor*. Mr. E. JENNER also has sent me fine specimens of it from a corn-field near Westfield, Sussex.

**LOCALITIES.**—On maritime cliffs in the south of England.—*Hants*; Cliffs between Steephill Cove and Ventnor Cove, Isle of Wight: N. B. G. On the chalk cliffs below Afton Down, east of Freshwater Gate, Isle of Wight, where it grows in great abundance, in places only accessible by a rope from above, truly wild, the cliff being the boundary on the sea side of the most solitary sheep-walks, without a human habitation, or even a spot of cultivation within three quarters of a mile: Dr. W. A. BROMFIELD.—*Sussex*; On the cliffs to the east of Hastings, 1806: DAWSON TURNER, Esq. and W. BORRER, Esq.—Now lost there: N. B. G., 1835.

**Shrub.**—Flowers from the end of April to August.

**Root** somewhat woody; simple at the crown, much branched below. **Stem** from 1 to 2 feet high, upright, bushy, round, leafy, hoary. **Leaves** scattered, from 2 to 6 inches long, covered on both sides with dense, starry, hoary pubescence, single-ribbed, entire, thick and leathery; rounded at the extremity; each tapering at the base into a short petiole (*leaf-stalk*). **Flowers** corymbose, large and handsome, sweet-scented, of a light purple colour. **Petals** rounded and nearly entire, their claws (see fig. 3.) pale and greenish. **Pods** (fig. 6.) from 2 inches to 3 inches and a half long, crowned with the sessile stigma subtended at each side by a small point. **Valves** strap-shaped, slightly keeled. **Seeds** numerous, almost circular, compressed, light brown, with a white membranous border.

This beautiful plant is a native of most parts of the South of Europe near the sea; it has been cultivated in our gardens for more than 200 years, but it was not known to be a native of England till it was found near Hastings by Messrs. TURNER and BORRER, in 1806, as stated above.

The principal varieties in cultivation are the single and double purple; the single and double scarlet; and the single and double white.

I am indebted to Dr. W. ARNOLD BROMFIELD, of Ryde, in the Isle of Wight, for several wild specimens of this species gathered by him near Freshwater-Gate, as recorded above. The specimen figured, was kindly communicated to me by J. P. NORMAN, Esq. of Exeter Coll. Oxford, from the same locality in the Isle of Wight.

For the best methods of cultivating the Garden varieties of this favourite plant, see LOUDON'S *Encyclopædia of Gardening*, (new edit., 1835.) p. 1050. parag. 5955.; DON'S *General System of Gardening & Botany*, v. i. p. 153.; and MARTYN'S edition of MILLER'S *Gardener's and Botanist's Dictionary*, under the Article *Cheiranthus*. And for a Historical account of it, see PHILLIPS' *Flora Historica*, 1st ed. v. ii. p. 24.; 2nd ed. v. ii. p. 19.

In the language of flowers, the *Gillyflower*, or *Stock*, is made the emblem of lasting beauty; for, although it is less graceful than the Rose, and not so superb as the Lily, its splendour is more durable, and its fragrance of longer continuance.

Yorksh. p. 60.—Leight. Fl. of Shropsh. p. 405.—Guilliv. Catal. Pl. of Banb. p. 17.—Mack. Fl. Hibern. p. 154.—*Verbesina, seu Cannabina aquatica, flore minus pulchro, elatior et magis frequens*, Ray's Syn. p. 187.—Bauh. Hist. v. ii. p. 1073.—*Eupatorium cannabinum fæmina*, Johns. Ger. p. 711.

LOCALITIES.—In watery places, and on the sides of wet ditches, ponds, and canals; frequent.

Annual.—Flowers in August and September.

*Root* simple, and tapering; with many whitish fibres. *Stem* from 1 to 3 feet high, upright, somewhat angular, solid, smooth, often purplish, leafy, with opposite, axillary branches. *Leaves* opposite, on dilated, winged, connate, ciliated petioles, in 3, sometimes 5, deep, spear-shaped, pointed, strongly serrated segments; dark green above, paler beneath. *Flowers* solitary, terminal, of a brownish yellow, somewhat drooping. *Outer Scales (or bracteas) of the Involucrum* about 8, unequal, spear-shaped, pointed, much longer than the flowers, their margins entire or serrated, and fringed with upright bristles. *Inner Scales of the Involucrum* upright, egg-spear-shaped, blunt, purplish and downy at the apex, their margins membranous, and marked with greenish-brown parallel streaks. *Florets* (see fig. 1.) tubular, dilated upwards, 4- or 5-cleft, segments acute, spreading and recurved. *Fruit* oblong-wedge-shaped, with 4 bristly angles, very much compressed. *Pappus* of 2 or 3 upright, stout bristles, armed with smaller deflexed ones, nearly as long as the floret, and arising from the angles. *Receptacle* (see fig. 6.) nearly flat, covered with strap-spear-shaped, pointed, chaffy scales (see fig. 1.), as long as the florets. A variety sometimes occurs with radiant, 3-toothed, marginal florets; and another in which the leaves are all undivided, but attention to their being petiolate, and to the *outer involucral bracteas* being many times longer than the flowers, will distinguish it from the other British species.

A dye may be prepared from this plant, with alum, to stain cloths yellow. It is very acrid, and when chewed excites salivation. **LIGHTFOOT** states, that in chemical qualities it much resembles the celebrated *Verbesina Acmella*, Linn Sp. Pl. p. 1271, (*Spilanthes Acmella*, Willd. Sp. Pl. v. iii. pt. III. p. 1713), and therefore infers the probability of its proving serviceable in calculous complaints.—The seeds have been known sometimes to destroy the *Cyprinus auratus*, or *Goldfish*, by adhering to their gills or jaws. Some very interesting remarks, by Dr. R. BROWN, relative to the British species of *Bidens*, may be seen in Dr. JOHNSON's admirable “Flora of Berwick-upon-Tweed,” v. ii. p. 287.; but they are too long to copy here.

PAMPLIN, jun.—*Yorksh.* On the foot-road from Thirsk to Thirby; cornfields at Clapgate, near Richmond; near Rotherham; Pontefract; and Beverley; and on the Wolds. Never of long continuance in one station: Mr. BAINES. Hesslington Fields near York: Sir T. FRANKLAND.—*WALES.* Montgomerysh. Cornfield near Welchpool: N. B. G.—*SCOTLAND.* Found occasionally in the counties of *Argyle*, *Ayr*, *Edinburgh*, *Fife*, *Forfar*, *Lanark*, *Orkney*, and *Ross*.—*IRELAND.* In fields, occasionally among Flax, with which it has been imported: *Fl. Hibern.*

#### Annual.—Flowers in June and July.

*Root* small, tapering, fibrous. *Stem* from 18 inches to 2 or 3 feet high, simple, panicled above, smooth, or more or less downy. *Leaves* alternate, spear-shaped, pointed, bright green, 2 or 3 inches long, entire, or slightly toothed, sometimes more or less hairy; clasping the stem with their arrow-shaped base. *Flowers* small, pale yellow, in loose corymbose clusters. *Petals* blunt, entire (see fig. 4). *Pouches* (see figs. 5 & 6.) on long fruit-stalks, spear-shaped, bordered, 4-ribbed, smooth, inflated, and veiny; terminated by the long *style*. *Seeds* (see fig. 7.) 6 or 8 in each cell, slightly angular, inversely egg-shaped, entire at the end.

This plant is a native of Germany and the southern counties of Europe, in cornfields, and especially among Flax, with the seed of which it has been introduced into the more northern parts, as Sweden, Denmark, and Britain. It is cultivated in Germany for the sake of the expressed oil of the seeds, which the inhabitants use for medicinal, culinary, and economical purposes.

The seeds are said to be a favourite food with geese; horses, cows, goats, and sheep, eat the plant.

Professor BURNETT observes, that the pompous provincial name, *Gold-of-Pleasure*, is thought to have a satirical reference to the disappointment gold spent in pleasure falsely so called entails.

**LOCALITIES.**—In open fields, and heathy places, on a chalky soil.—*Oxfordsh.* Common enough about Oxford: D. BOBART. Woodstock Park: Mr. J. SHERARD. Burford Downs: Rev. Dr. GOODENOUGH. Shadwell Copse, between Cumnor Hurst and Childswell Farm. On the Leys about a mile E. from Upper Heyford. Between Upper Heyford and Northbrook. Side of the road between Witney and Burford; and between Stonesfield and Woodstock Park: W. B.—*Beds.* Clapham, between Woods: ABROT. Houghton Conquest Park: B.G.—*Cambridgesh.* Hedges and dry fields, remaining green in the driest places where other plants are all withered: RELHAN.—In *Derbysh.*: N. B. G.—*Devon*; Chudleigh; Ingsdon near Ilsington; Bovey Tracey; and Ashburton: *Fl. Dev.*—*Dorset*; Common on the chalky Downs; cornfields near the turnpike-gate, Weymouth; near Broadway and Blandford: B. G.—*Gloucestersh.* St. Vincent's Rocks; and Broadway Hill: B. G.—*Kent*; Chalk-hills; Shakespeare's Cliff; and Dover Cliffs: N. B. G. Between Radigund's Abbey and Dover; and on Narbourne Downs: B. G. On Shorne Cliff: Rev. G. E. SMITH.—*Leicestersh.* On the Wolds among Furze; most common on the eastern side of the county: Dr. PULTENEY.—*Norfolk*; Earsham, and elsewhere about Bungay: B. G.—*Notts*; Rather frequent on the magnesian limestone: N. B. G.—*Somersetsh.* At Charlcombe; and on the Canal-bank near Bathampton: *Fl. Bath*.—*Suffolk*; About Bungay: B. G.—*Surrey*; Between Dorking and Ranmore Common: N. B. G. Shirley Common, near Croydon: Mr. W. PAMPLIN, jun.—*Sussex*; Many places on the Downs: N. B. G.—*Warwicksh.* Grafton, and Great Alne: T. PURTON, Esq.—*Worcestersh.* Abundantly in almost every pasture of a clayey soil in the neighbourhood of Great Comberton and Pershore: NASH. Badsey: T. Purton, Esq.—*Yorksh.* Near Bramham, and Market Weighton: Cave Hole Wood; Giggleswick Scar; under a wall near Stackhouse; near Nunnington, and other places about Castle Howard; Byland Wood, near Coxwold; road-side between Ferrybridge and Doncaster; Walkingham Warren, near Farnham; about Wetherby, plentifully: N. B. G. Thorp Arch; and Roche Abbey: Mr. BAINES.—*SCOTLAND.* *Fifeshire*; Near North Queensferry: Mr. NEILL.—*IRELAND.* In hedges near Kinsale: Mr. J. DRUMMOND.

### Perennial.—Flowers in July.

*Root* fibrous, somewhat creeping. *Culms (stems)* from 18 inches to 2 feet high or more, upright, roundish, striated, smooth, leafy, simple. *Leaves* somewhat upright, strap-spear-shaped, taper-pointed, rather rigid, striated, roughish, and mostly destitute of hairs. *Sheaths* upright, upper ones smooth, lower hairy. *Stipule* short, blunt, and ciliated. *Spike* upright, 2-ranked. *Spikelets* from 6 to 10, alternate, strap-shaped, upright, sessile; composed of from 6 to 12, closely imbricated florets. *Glumes* (fig. 2.) unequal, spear-shaped, nerved, slightly awned. *Outer Palea* (see fig. 3.) with 5 or 7 ribs, somewhat hairy at the margin, with a terminal awn, shorter than itself, sometimes scarcely any. *Inner Palea* retuse, its margins incurved, with a fringed rib on each side.

Mr. SINCLAIR observes, that this Grass cannot as yet be considered in any other light than as a noxious weed; for though the weight of produce is considerable, it is neither early, nutritive, or relished by cattle.

*Menziesia polifolia*. Potion-leaved Menziesia. h  
Ruf. Col. Vol.

Pub'd by W. Baxter, Botanic Garden, Oxford, 1841.

## MENZIE'SIA \*.

*Linnean Class and Order.* OCTA'NDRIA †, MONOGY'NIA.

*Natural Order.* ERI'CEÆ, Brown's Prod. p. 557.—Lindl. Syn p. 172; Introd. to Nat. Syst. of Bot. p. 182.—Loud. Hort. Brit. p. 523.—Mack. Fl. Hibern. p. 179.—Hook. Brit. Fl. (4th ed.) p. 411.—ERICA'CEÆ; subtribe, ERI'CEÆ NORMA'LES, Don's Gen. Syst. of Gard. and Bot. v. iii. pp. 785 & 786.—Loud. Arb. et Frutic. Brit. pp. 1076 & 1079.—ERICINEÆ, Rich. by Maegilliv. p. 450.—RHODODENDRA, Juss. Gen. Pl. p. 158.—Sm. Gr. of Bot. p. 114.—SYRINGALES; subord. ERICOSÆ; sect. ERICINÆ; type, ERICACEÆ; subtype, ERICIDÆ; Burn. Outl. of Bot. v. ii. pp. 900, 937, 944, 946, and 948.—BICORNES, Linn.

**GEN. CHAR.** *Calyx* (fig. 1.) inferior, of 1 sepal, divided nearly to the base into 4 or 5 segments, permanent. *Corolla* of 1 petal, inflated, nearly egg-shaped, deciduous; limb in 4 or 5 small, spreading, equal segments. *Filaments* (fig. 2.) 8 or 10, thread-shaped, equal, shorter than the corolla, inserted into the receptacle. *Anthers* oblong, without horns or crest; cloven at the base; opening by 2 pores at the summit. *Germen* superior, roundish, furrowed. *Style* (see figs. 1 & 3.) upright, angular, rather longer than the stamens. *Stigma* blunt, with 4 or 5 small notches. *Capsule* (see figs. 4 & 5.) elliptic-oblong, with 4 or 5 furrows, and as many valves and cells; the partitions (dissepiments) formed by the inflexed margins of the valves, and opening between them. *Seeds* (fig. 6.) numerous, small, oblong, acute, affixed to the ribs of the central column.

The inferior, deeply 4- or 5-parted *calyx*; the ventricose *corolla*, with a spreading 4- or 5-toothed limb; and the 4- or 5-celled, many-seeded *capsule*, with 4 or 5 valves dehiscing through the dissepiments; will distinguish this from other genera in the same class and order.

Two species British.

MENZIE'SIA POLIFO'LIA. Polium-leaved Menziesia. Irish Menziesia. Irish Heath. Irish Whorts. St. Dabeoc's Heath. Heath Gardrobe.

**SPEC. CHAR.** Leaves egg-shaped, the margins revolute; downy and white beneath. Flowers 4-cleft, with 8 stamens, in terminal leafy racemes.

Inst. p. 603.—Dill. in Ray's Syn. p. 472.—*Erica hibernica, foliis myrti pilosis subtus incanis*, Pet. Gazoph. p. 6. t. 27. f. 4.—*Andromeda Daboezia*, Linn. Syst. Veg., 13th ed. p. 338.; 14th ed. p. 408.; 15th ed. p. 434.—With. 1st ed. v. i. p. 247.; 2nd ed. v. i. p. 425.—*Vaccinium Cantabricum*, Huds. Fl. Angl. (1st ed.) p. 143.—*Daboezia polifolia*, D., Dou in Edin. Phil. Journ. 17. p. 160.—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 833.—Loud. Arb. et Frutic. Brit. v. ii. p. 1116, with a figure.—Macr. Man. Brit Bot. p. 150.

**LOCALITIES.**—On mountains in the west of Ireland, in a boggy soil. Frequent on dry heaths over all the wild district of Cunnamara, and the mountainous parts of Mayo: *Fl. Hib.*—It is recorded, in WATSON's *New Botanist's Guide*, on the authority of Miss BELL, as having been gathered in Sherwood Forest, in Nottinghamshire; but Mr. WATSON doubts whether it might not have been planted there.

**Shrub.**—Flowers in June, July, and August.

Stems bushy, from 12 to 18 inches high, much branched, nearly cylindrical, leafy, clothed with projecting hairs, often of a reddish-brown colour. Leaves numerous, rather crowded, on short petioles, usually alternate, sometimes opposite, or even three together; dark green and shining above, with a few scattered, glandular hairs; densely clothed with white cottony down beneath, their margins entire, and slightly revolute. Flowers large, and handsome, drooping, purplish-red, in terminal, simple racemes, each on a simple, somewhat viscid pedicel, accompanied by a small, strap-shaped, hairy bractea at its base. Calyx (fig. 1.) in 4, deep, acute, hairy, viscid segments. Corolla (fig. 4.) egg-shaped, a little contracted at the mouth, with 4 blunt angles, and 4 recurved segments. Stamens (fig. 2.) 8, with white filaments. Anthers nearly as long as the filaments, a little shorter than the corolla, brown, somewhat arrow-shaped at the base. Capsule (see fig. 5.) of 4 cells, with partitions from the edges of the valves.

A white-flowered variety is cultivated in gardens; it has also been found wild in Ireland, (see Loud. Mag. Nat. Hist. v. iv. p. 167.) growing along with the common variety. Both varieties are highly deserving a place in the flower-garden, and are well fitted for decorating the front of shrubberies, or to be grown on rock-work or banks.

---

The *Natural Order ERICEÆ* consists of dicotyledonous *shrubs* or *under shrubs*, with opposite or whorled, mostly evergreen and rigid leaves, without stipule. The *calyx* is inferior, permanent, and divided into 4 or 5 segments. The *corolla* is of 4 or 5 divisions, regular or irregular, almost hypogynous, generally withering. The *stamens* are definite, and either equal in number to the segments of the corolla, or twice as many. The *anthers* are 2-celled, the cells separating at the apex or at the base, opening by pores, and often furnished with some kind of appendage. The *ovary* is surrounded by a disk or scales, and is many-celled, and many-seeded. The *style* is simple, with an undivided or lobed *stigma*. The fruit is *capsular*, many-celled, and many-seeded, with a central receptacle. The *seeds* are small, and have a fleshy albumen.

The British Genera in this order are—*Erica*, t. 418.—*Calluna*, t. 76.—*Menziesia*, t. 449.—*Azalea*.—*Andromeda*, t. 361.—*Arbutus*—and *Ledum*.

*Barbarea vulgaris.* Bitter Winter-creep. II

Russell Del.

Pub'd by W. Backen Botanic Garden Oxford 1842.

Methuen. Sc.

## BARBARE'A\*.

*Linnean Class and Order.* TETRADYNA'MIA†, SILIQUO'SA‡.

*Natural Order.* CRUCIFERÆ§, Juss. Gen. Pl. p. 237.—Sm. Gram. of Bot. p. 138.; Engl. Fl. v. iii. p. 153.—Rich. by Macgilliv. p. 498.—CRUCIFERÆ; subord. PLEURORHIZEÆ||; tribe, ARABIDEE, Lindl. Syn. pp. 20 & 22; Introd. to Nat. Syst. of Bot. pp. 14 to 18.—Loud. Hort. Brit. pp. 498 & 499.; Mag. of Nat. Hist. v. i. pp. 143 & 239.—Don's Gen. Syst. of Gard. and Bot. v. i. pp. 146 & 147.—Mack. Fl. Hib. pt. i. p. 16.—Hook. Brit. Fl. (4th edit.) p. 397.—ROSALES; subord. RHÆADOSÆ; sect. RHÆADINÆ; type, BRASSICACEÆ; subtype, ARABIDÆ; Burn. Outl. of Bot. pp. 614, 784, 847, 854, & 856.—SILIQUOSÆ, Linn.

**GEN. CHAR.** *Calyx* (figs. 1 & 2.) inferior, nearly equal at the base, upright; of 4 oblong, concave, somewhat coloured, deciduous sepals. *Corolla* (fig. 3.) cruciform, of 4 inversely egg-shaped, blunt, undivided, flat petals; their claws (see fig. 4.) nearly as long as the calyx. *Filaments* (see fig. 5.) 6, awl-shaped, simple, distinct, upright, with a *gland* at each side between the two shorter ones and the *pistil*. *Germen* (see fig. 5.) oblong, quadrangular. *Style* (see figs. 5 & 6.) short, cylindrical. *Stigma* blunt, simple. *Pod* (figs. 6 & 7.) 4-angled, and somewhat 2-edged; valves concave, keeled, even and straight; partition (see fig. 8.) membranous, thick-edged. *Seeds* (see fig. 8.) ranged alternately, in a single row, egg-shaped, flattish, not bordered; cotyledons flat, accumbent (o=), see fig. 10.

The upright *calyx*; the 4-angled, slightly compressed *pod*; the *seeds* in a single row; and the two shorter *filaments* with glands at the inside, between them and the *pistil*; will distinguish this from other genera, with flat accumbent *cotyledons*, in the same class and order.

Two species British.

**BARBARE'A VULGARIS.** Common Winter-cress. Bitter Winter-cress. Yellow Rocket. Herb St. Barbara. Winter Hedge-mustard.

**SPEC. CHAR.** Lower leaves lyrate, the terminal lobe rounded; upper inversely egg-shaped, toothed, often pinnatifid at the base. Pods linear, bluntly 4-angled, pointed with the style.

(3rd ed.) p. 268.—*Eruca lutea seu Barbarea*, Ray's Syn. p. 297.

LOCALITIES.—In moist waste places, about hedges, banks of ditches, and in marshy meadows; frequent.

Perennial.—Flowers from May to August.

*Root* tapering, somewhat woody. *Stem* from 12 to 18 inches high, upright, stout, simple or branched, angular and furrowed, smooth, leafy. *Leaves* alternate, lower ones lyrate, with a large, roundish, terminal lobe; upper ones inversely egg-shaped, toothed, often pinnatifid; all smooth, strongly ribbed, of a firm texture, and clasping the stem by their arrow-shaped base. *Flowers* small, bright yellow, in roundish, corymbose clusters. *Sepals* oblong-egg-shaped, concave, 3-ribbed, upright. *Petals* twice the length of the sepals, inversely egg-shaped, veiny, their claws upright, the limb spreading. *Pod (siliqua)* upright, strap-shaped, smooth, not very acutely 4-angled, six times as long as the spreading pedicel, crowned with the narrow, rather elongated, *style*, which is about half the length of the pedicel. *Seeds* inversely egg-shaped, compressed, minutely and deeply pitted.

A variety with double flowers is cultivated in gardens, under the name of Double Yellow Rocket.

The whole herb has a nauseous bitter taste, and is in some degree mucilaginous; it is sometimes cultivated as a Spring salad, but it has nothing in flavour to recommend it. In Sweden they boil the leaves as kale. Cows are said to eat this plant; horses and swine to refuse it; goats and sheep are not fond of it.—A minute species of *Tipula*, or Gall Gnat, sometimes renders the flowers like a Hop-blossom; but this metamorphosis does not strictly partake of the nature of galls, as it originates not from the egg, but from the larva, which, in the operation of extracting the seed in some way imparts a morbid action to the juices, causing the flower to expand unnaturally. A parasitical, white fungus, *Uredo candida*, of Persoon, is common on the under side of the leaves, and on the stem of this plant, in the Summer.

---

I long to hold communion safe as sweet  
With trees and flowers; they are no demagogues,  
They teach no treason, nor with guilty strife  
Seek for advancement through another's fall:  
The flow'ret that on scarce an inch of earth  
Peeps through the crevice of some mossy wall,  
Is as contented as the giant oak  
That covers half an acre with its shade \*.

**LOCALITIES.**—In salt-water pools and ditches.—*Cambridgesh.* Ditches below Wisbeach.—*Cornwall*; Salt ditches.—*Devon*; Exminster and Powderham Marshes; salt ditches near Starcross; and Braunton Burroughs.—*Dorset*; Ditches on the coast; at Pool.—*Durham*; Near Tees' Mouth.—*Essex*; In a ditch by the road-side between Heybridge and Goldhanger, near Maldon.—*Hants*; By the ferry over the river Itchen, near Southampton.—*Kent*; Dikes and pools near the sea at Dimchurch; and in the marsh ditches at Sheppey, plentiful.—*Norfolk*; Salt-water ditches near Yarmouth; Caistor; Bradwell, &c.—*Northumberland*; In Meggy's Bourn, north of Seaton Sluice.—*Somerset*; Salt marsh at the base of Brean Down.—*Suffolk*; Salt-marsh ditches at Aldborough and Orford; at Dunwich; and about Yarmouth.—*Sussex*; Rye and Shoreham: W. BORRER, Esq. Salt-pans Birdham, near Chichester; and in Chichester Creek: Mr. E. JENNER.—*Yorksh.* Salt-water ditches in the marshes at Coatham: Mr. BAINES. Tees' Mouth.—*Wales*. *Anglesea*; Not rare; between Beaumaris and Penmon, &c.; near Llanddwyn.—*Caernarvonsh.* Ditches between Treath Mawr and Pont Aberglaslyn.—*Denbighsh.* Not common.—*SCOTLAND*. *Elginsh.* Kinloss, near the school-house.—*Forfarsh.* Montrose.—*Haddingtonsh.* Salt-water pools on Guillons Links; Aberlady Bay.—*Inverness-shire*; Glen Elg.—*Kincardinesh.* In the neighbourhood of Bervie.—*Kirkcudbrightsh.* Kirkcudbright Loch. [For authorities, see N. B. G.]—*IRELAND*. Near the N. Wall, Dublin. Near Passage, county of Cork. Abundant along the shore of Lough Foyle. *Fl. Hibern.*

**Perennial.**—Flowers in July and August.

*Plant* submersed. *Roots* fibrous, in tufts from several of the lower joints of the stem. *Stems* long, slender, thread-shaped, flexuous, much branched, leafy. *Leaves* alternate, strap-shaped, very narrow, more or less pointed, channelled; clasping the stem with their *sheaths*, which are sometimes narrow and small, at other times large and inflated. *Spadix* (see figs. 4 & 5.) at first very short, included in the sheath of the leaves, with 2 green *flowers*, one above another on opposite sides, and quite destitute of either *ealyx* or *corolla*. *Anthers* (see fig. 3.) 4, large, sessile, bursting horizontally, 1-celled. MERTENS and KOCH say that each pair is, in fact, the 2 cells of 1 anther; and that there are, in reality, but 2 sessile stamens. *Pollen*, a tube with 3 globules, one in the middle, and one at each end of the tube. *Germens* (see fig. 5, a.) 4, occasionally 5 or 6, resembling minute tubercles in the centre between the anthers; as these approach maturity their base elongates into a fruit-stalk, one or two inches long (see fig. 2.); each then becomes an oblique, egg-shaped, more or less pointed, *pericarp*, (see fig. 8.), inclosing a single seed.

This plant, when not in fruit, very much resembles *Potamogeton pectinatum*. “Its whole history,” observes the Rev. G. E. SMITH, “is deeply interesting, and raises the humble and hidden tenant of the dyke to rivalry with the celebrated *Valesneria*;” for, like that plant, it lengthens or contracts its flower-stalk according to the greater or less depth of the water; and, assuming a spiral form, the flowers are thus elevated above the surface, where the anthers burst, and discharge their pollen, after which the flower-stalk, bearing the fertilized stigmas, sinks within the bosom of its parent plant.

For many interesting particulars relative to the history and economy of this curious plant, see HOOKER'S *Flora Londinensis*, t. 50.; and the Rev. G. E. SMITH'S *Catalogue of Plants*, collected in South Kent, pp. 9—12.

The specimen from which the drawing for the accompanying plate was made, was kindly communicated to me by my friend Mr. E. JENNER, of Lewes, Sussex.

*Cyperus longus* Sweet Cyperus. II

Mathew's Del Br.

Pub'd by W. Baster, Botanic Garden Oxford, 1861.

## CYPERUS\*.

*Linnean Class and Order.* TRIA'NDRIA†, MONOGY'NIA.

*Natural Order.* CYPERA'CEAE‡, Juss.—Lindl. Syn. p. 278.; Introd. to Nat. Syst. of Bot. p. 304.—Rich. by Macgilliv. p. 392.—Loud. Hort. Brit. p. 541.—Mack. Fl. Hibern. p. 318.—Hook. Brit. Fl. (4th ed.) p. 427.—CYPEROIDEAE, Juss. Gen. Pl. p. 26.—Sm. Gr. of Bot. p. 68.—CYPERALES; sect. CYPERINAE; type, SCIRPACEAE; Burn. Outl. of Bot. v. i. pp. 354 & 357.—CALAMARIAE, Linn.

**GEN. CHAR.** Spikelets (fig. 1.) mostly strap-shaped, compressed, of numerous flowers (see fig. 2). Glumes (see fig. 2.) of one valve, uniform, keeled, imbricated in 2 opposite ranks, all perfect, except one or two at the bottom. Filaments (see fig. 2.) 2 or 3, short. Anthers strap-shaped. Germen (see figs. 2 & 3.) roundish, without bristles beneath. Style (see fig. 3.) simple at the base, deciduous. Stigmas (see fig. 3.) 2 or 3. Seed pointed, smooth, loose.

The 2-ranked, many-flowered spikelets; the glumes of 1 valve, equal, and nearly all fertile; and the inarticulated, deciduous style, without bristles; will distinguish this from other genera in the same class and order.

Two species British.

CYPERUS LO'NGUS. Long Cyperus. Sweet Cyperus. English Galingale.

**SPEC. CHAR.** Stem triangular. Spikelets strap-spear-shaped, nearly upright, in doubly compound umbels. General Involucrum very long, leafy; partial one small.

Engl. Bot. t. 1309.—Jacq. Icon. Ror. t. 297.—Johnson's Gerarde, p. 30 †.—Ray's Syn. p. 425.—Linn. Sp. Pl. p. 67.—Huds. Fl. Angl. (2nd ed.) p. 17.—Willd. Sp. Pl. v. i. pt. I. p. 285. *excl. Rottb. Syn.*—Sm. Fl. Brit. v. i. p. 47.; Engl. Fl. v. i. p. 53.—With. (7th ed.) v. ii. p. 106.—Gray's Nat. Arr. v. ii. p. 70.—Lindl. Syn. p. 279.—Hook. Brit. Fl. p. 19.—Macr. Man. Brit. Bot. p. 245.—Schrad. Theat. p. 216.—Moris. v. iii. p. 237. sect. 8. t. 11. f. 13.—*Cyperus odoratus, radice longa*, Scheuchz. Agrost. p. 378. t. 8. f. 12.

**LOCALITIES.**—In marshes, but very rare.—**Kent**; This rare and very elegant Grass is spread over a confined, black, boggy track at Whiting Brooks, above the Warren, near Seabrooke: Rev. G. E. SMITH.—**Somerset**; In an old fish-pond at the back of a cottage at Walton-in-Gordano: B. G.—**Wilts**; In 1839, Mr. PEETE found about a quarter of an acre of *Cyperus longus*, within a quarter of a mile of Boyton House: Mr. W. PAMPLIN, jun. in N. B. G.—**WALES**. **Pembrokeshire**; By a little rivulet that runs into Whitsand Bay, between St. David's Town and St. David's Head: Sir JOHN CULLUM.

Perennial.—Flowers in July and August.

**Root** moderately creeping, aromatic, and astringent. **Culm** (stem) from 2 to 3 feet high, simple, without joints, triangular, smooth, shining, leafy and sheathing at the bottom. **Leaves** long, and narrow, striated, very rough on the upper surface and at the margins,

Fig. 1. A Spikelet.—Fig. 2. A separate Flower.—Fig. 3. Germen, Style, and Stigma.—Figs. 2 & 3, magnified.

\* From *kyparos*, Gr. a vase, or round vessel; in allusion to the form of the root.

† See fol. 56, note †.

‡ See fol. 436, a.

smooth beneath; sheaths very long, especially those of the leaves which rise highest, as they all run down to the base of the stem. *Umbel* large, terminal, accompanied by an involucrum of 4 or 5 leaves, one of which is often nearly or quite 2 feet long. *Peduncles* triangular, smooth, the outer one about 6 inches long, the rest gradually shorter, each with a sheathing bractea at its base. *Pedicels (partial flower-stalks)* slender, triangular, smooth, from the 8th of an inch to an inch long, subtended by small bracteas. *Spikelets* shining brown, narrow, upright, 5 or 6 together, loosely spreading in two directions. *Stigmas* 3.

This is a very graceful plant, and is found wild in France, Germany, Italy, Sicily, and Carniola, as well as in Britain. The root has a pleasant aromatic smell, and a warm bitter taste; but it is not used medicinally, though Dr. WILHELM says, perhaps it is not inferior to some more costly medicines brought from abroad.

" From earliest childhood I have ever found  
Companionship in flowers, and shall methinks  
Until my dying day. They seem, fair things,  
(At least when Fancy gifts them with her spell)  
To understand and share my every mood  
More readily than creatures rational.  
If glad of heart, they give me smile for smile,  
If sorrowful, they yield me solace sweet,  
Or if to holier thoughts my heart incline,  
They never check, like the cold scorning world,  
My heavenly aspirations, but at once  
Take up a serious, monitory strain,  
And preach sweet homilies more touching far  
Than often flow from learned doctor's tongue.  
Next to that Book which shows to guilty man  
How he, through mercy infinite, may gain  
More than he lost in Eden, I do rank,  
And justly so, sweet nature's varied lore,  
For well it seconds many a glorious truth  
Which in that better record stands reveal'd.  
The furious hurricane that rends the heavens,  
And makes the scared and desolated earth  
Reel like a drunkard, the resistless flood,  
The barren waste, nay, e'en the very thorn  
Which wounds our finger when we pluck the flower,  
And noxious weed that ' mocks the hope of toil,'  
Do all attest one truth, man's foul revolt.  
The changing seasons, winter's death-like reign,  
So soon succeeded by the bloom of spring,  
What are they but the types of man's decease  
And resurrection? The blithe birds which build  
Beneath our cottage eaves,—the smiling flowers  
Which decorate the hedgerow and the mead,  
Do they not mind us to repose our trust  
On HIM, who feeds and clothes them day by day?  
What says the lip of Wisdom? ' Mark the fowls,  
Which neither sow, nor reap, nor store in barns,  
And yet your heavenly Father feedeth them.  
Consider too the lilies, how they grow,  
They neither toil nor spin, and yet I say  
That Solomon in all his glorious pomp  
Was not array'd like these. Wherefore if GOD  
Thus clothes the grass, so soon to pass away,  
And feed the fowls of heaven, shall HE not then  
Much rather for your daily wants provide,  
O ye of little faith?"

From *Recollections of the Lakes*, by the author of  
the "Moral of Flowers."

\* So named by the Romans from a sort of spear, the shape of which the leaves of several species of the genus nearly resemble. WITHERING.

† See folio 33, note †.

‡ See folio 311, a.

**LOCALITIES.**—By way-sides, in waste places, and in pastures; too common.

**Perennial.**—Flowers in July and August.

*Root* tapering, running deeply and perpendicularly into the ground, simple or branched, of a dirty brown colour on the outside, yellowish within. *Stems* from 2 to 3 feet high, upright, branched, solid, round, deeply furrowed, leafy, roughish upwards. *Leaves* all petiolate, smooth, except on the under surface where the veins and also the petioles are rough; *radical ones* very large, broad, and more or less heart-shaped at the base; *those of the stem* narrower and acute, the uppermost spear-shaped, and tapering at both ends. *Clusters* elongated, of numerous, many-flowered whorls, which are near together, except a few of the lower ones, which are more distant and leafy. *Enlarged Petals* oblong, blunt, veiny, with about 3 teeth on each margin, one of them also bearing a brown or reddish tubercle, of a smaller proportion than in most species. *Seed* rather large, egg-shaped, acute, with 3 sharp angles.

The broad, blunt radical leaves, and the oblongo-triangular form of the enlarged petals, will distinguish this from the other species.

It is a most troublesome weed, being very tenacious of growth by its roots, and producing a great increase of seed. It can be only conquered by stubbing up the root; mowing is to little purpose.

SWIFT seems to have been aware of this when he wrote the following lines:—

My love for gentle Dermot faster grows  
Than you tall *Dock*, that rises to thy nose:  
*Cut down the Dock*, 'twill rise again; but know  
Love rooted out, again will never grow.

Dr. WITHERING observes, that Fallow Deer eat both this and *Rumex acutus* with avidity, biting it close to the root, so that it is very rare to see a *Dock* growing in a deer park.

It has been remarked, that the *Dock* is never found to prosper in bad or unfertile soils. Dr. KEITH, in his *General View of the Agriculture of Aberdeenshire*, at p. 443, relates an Anecdote of a man who, some years ago, took a small farm in the division of Marr, Aberdeenshire. When the man entered to it, at the usual time, viz. Whitsunday, he found that there was not a weed of the *Dock* kind on the farm. At Candlemas, or nine months after, he called on the proprietor, and apprized him that he should leave it. The Gentleman asked him, “Why he gave up a farm before he saw what crop he could raise on it?” He replied, “Sir, there was not a *Dockan*” (the provincial name for *Dock*) “on it at Whitsunday. I brought *Dockans* from different places, and have planted them, but they have not answered at all; and I know that what will not grow *Dockans* cannot grow corn.” This self-taught botanist, observes Dr. KEITH, was perfectly right; for the farm was really a bad one.

In the north of England *Docks* are sometimes boiled as food for pigs; and the broad leaves of this species were formerly much used for the wrapping up of butter, and hence the plant was called *Butter-dock*.—A parasitic fungus, *Aecidium rubellum*, Pers., one of the most beautiful of the genus, is occasionally found in perfection on the leaves of this, and 2 or 3 other species in the neighbourhood of the Cherwell and the Isis, near Oxford. I have also found it, very fine, on *Rumex acetosa*, on the south side of Shotover Hill. This beautiful parasite is well represented in the late Mr. PURTON’s excellent “Midland Flora,” v. iii. t. 26.

## SE'SELI \*.

*Linnean Class and Order.* PENTANDRIA †, DIGYNIA.

*Natural Order.* UMBELLIFERÆ †, Juss. Gen. Pl. p. 218.—Sm. Gram. of Bot. p. 132.—Lindl. Syn. p. 111.; Introd. to Nat. Syst. of Bot. p. 4.—Rich. by Macgilliv. p. 463.—Loud. Hort. Brit. p. 517.—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 235.—Mack. Fl. Hibern. p. 113.—Hook. Brit. Fl. (4th ed.) p. 408.—UMBELLATÆ, Linn.—ROSALES; sect. ANGELICINÆ; type, ANGELICACÆ; subty. ANGELICIDÆ; Burn. Outl. of Bot. v. ii. pp. 614, 770, 773, & 774.

**GEN. CHAR.** *Flowers* imperfectly separated, regular, the innermost more or less abortive. *Calyx* (see figs. 2 & 5.) superior, of 5 spreading, ascending, spear-shaped, pointed, permanent teeth. *Corolla* (see fig. 1.) of 5 nearly equal, inversely heart-shaped *petals* with a broad inflexed point (see fig. 3). *Filaments* (see fig. 1.) 5, thread-shaped, spreading, incurved, longer than the petals. *Anthers* roundish. *Germen* (see fig. 2.) inferior, egg-shaped<sup>1</sup>, furrowed, downy, blunt. *Styles* (see fig. 2.) 2, in the flower short, upright, each with a large, tumid, egg-shaped base (see fig. 4.); subsequently spreading as far as the calyx, or farther, finally reflexed, permanent (see fig. 5). *Stigmas* simple, bluntnish. *Floral Receptacle* wanting. *Fruit* (see fig. 5.) oval or oblong, scarcely compressed, ribbed, clothed, more or less, with loosely spreading, shortish hairs, and crowned with the calyx and reflexed styles. *Carpels* with 5 prominent, corky ribs; the lateral of which form a margin, and are usually rather broader than the others. *Interstices* with a single *vitta* (see fig. 6). *Seed* almost half round. *Universal Involucrum* various; *partial one* of many leaves. *Flowers* white.

The *calyx* with 5 acute teeth; the oval or oblong *fruit*, crowned with the reflexed styles; and the *carpels* with 5 prominent, corky *ribs*, with single *vittæ* in the *interstices*; will distinguish this from other genera in the same class and order.

One species British.

SE'SELI LIBANOTIS. Mountain Stone-parsley. Mountain Meadow-Saxifrage. Mountain Spignel.

**SPEC. CHAR.** Stem furrowed. Leaves bipinnate; leaflets deeply pinnatifid, lower ones decussate; segments spear-shaped. *Fruit* egg-oblong, villous.

Koch. Umb. p. 111.—Lindl. Syn. p. 119.—Hook. Brit. Fl. p. 121.—Irv. Lond. Fl. p. 299.—Athamanta libanotis, Linn. Sp. Pl. p. 351.; Fl. Suec. (2nd ed.) p. 67.—Engl. Bot. t. 138.—Jacq. Fl. \* From *scycelyos*, the Arabic name of an umbelliferous plant, but to what plant it was given is now unknown. Don.

† See fol. 48, note †.

‡ See fol. 235, a.

Angl. (2nd ed.) p. 115.—With. (2nd ed.) v. i. p. 283. *Not of Linneus.*—*Libanotis vulgaris*, D C. Prod. v. iv. p. 150.—Don's Gen. Syst. of Gard. & Bot. v. iii. p. 312.—Maer. Man. Brit. Bot. p. 101.—*Libanotis montana*, Gray's Nat. Arr. p. 518.—*Libanotis daucoides*, Scop. Fl. Carn. N°. 317.—*Apium petraeum, sue montanum, album*, Bauh. Hist. v. iii. pt. ii. p. 105, with a figure.—Ray's Syn. p. 218.—*Daucus montanus, pimpinella saxifrage hircina folio, nostras, Dubriensis*, Plu. Almag. p. 129; Phyt. t. 173. f. 1.

**LOCALITIES.**—In chalky pastures; very rare.—Cambridgeshire; Chalk-pit Close, Hinton; in some old chalk-pits, on the right and left hand side of the road leading from Hinton towards the road to Gogmagog Hills, and on the banks. Not now found on Gogmagog Hills: RELIAN.—Cumberland; Keswick: Mr. HUTTON, in B. G. Probably not found there now, as this locality is not noticed in Mr. WATSON's *New Botanist's Guide*.—Hertfordshire; Between St. Albans's and Stoney-Stratford: HUDSON.

**Perennial.**—Flowers in July and August.

**Root** tapering, somewhat woody, bearded at the top with the fibrous remains of the old leaf-stalks. **Stem** from 1 to 3 feet high, upright, firm, angular and deeply furrowed, solid, smooth, not much branched, leafy principally in the lower part. **Radical Leaves** stalked, twice or thrice pinnate; **leaflets** opposite, deeply and sharply cut, smooth; the lowermost crowded, and often crossing each other. **Stem-leaves** alternate, twice pinnate, with pinnatifid leaflets. **Petioles (leaf-stalks)** somewhat compressed, channelled between the leaflets, dilated at the base with a membranous border. **Umbels** terminal, on long, upright, furrowed stalks, convex, of many stout, angular, downy *general rays*, and still more numerous *partial ones*. **Universal** as well as *partial involucrums* of many strap-spear-shaped, taper-pointed, downy leaves. **Flowers** crowded, white or reddish. **Germen** and **Styles** sometimes of a purplish colour. **Fruit** oblong egg-shaped, hairy.—The *terminal umbel* is sometimes proliferous, with the rays two inches long.

This is one of the most rare of our native plants, having been found only in the few stations recorded above. In Sweden, Denmark, Germany, Switzerland, Austria, Carniola, and the South of France, it is more frequent. The root is bitterish and pungent.

For the specimen from which the drawing for the accompanying plate was made, I am indebted to my kind friend Mr. E. JENNER, of Lewes, Sussex; a most excellent and indefatigable British Botanist.

---

Oh! were I spiritual as the wafting wind  
Which breathes its sighing music through the wood,  
Sports with the dancing leaves, and crisps the flood;  
Then would I glide away from cares which bind  
Down unto haunts that taint the healthful mind,  
And I would sport with many a bloom and bud,  
Happiest, the farthest from the neighbourhood,  
And from the crimes and miseries of mankind.  
Then would I waft me to the cowslip's bell;  
And to the wild-rose should my voyage be:  
Unto the lily, vestal of the dell;  
Or daisy, the pet-child of poesy;  
Or be, beside some mossy forest-well,  
Companion to the wood-anemone.

R. HOWITT.

Zostera marina. Common Graft-wrack. 4

## ZOSTE'RA \*.

*Linnean Class and Order.* MONŒ'CIA †, MONA'NDRIA ‡.

*Natural Order.* FLUVIA'LES §, Vent.—Lindl. Syn. p. 248.; Introd. to Nat. Syst. of Bot. p. 289.—Loud. Hort. Brit. p. 541.—Mack. Fl. Hibern. p. 264.—NAIADES, Juss. Gen. Pl. p. 18.—Sm. Gram. of Bot. p. 66.—Hook. Brit. Fl. (4th ed.) p. 423.—NAJADEÆ, Rich. by Macgilliv. p. 387.—JUNCALES; sect. NAYADINÆ; type, NAYADACEÆ; Burn. Outl. of Bot. v. i. pp. 403 and 413.—INUNDATÆ, Linn.

**GEN. CHAR.** *Flowers* monœcious; both *sterile* and *fertile ones* arranged in two rows upon one side of a common *spadix* (see fig. 3). *Spatha* oblong, formed of the base of a leaf, splitting lengthwise. *Sterile Flower* (see fig. 3, a. & fig. 4). *Calyx* none. *Corolla* none. *Anther* (see fig. 3, a. and figs. 4 & 5.) cylindrical, tapering at each end, sessile, of 1 cell. *Pollen* mixed with branched fibres (see fig. 5). *Fertile Flower* (see fig. 3, b. and fig. 6). *Calyx* none. *Corolla* none. *Germen* (see fig. 3, b. & fig. 6.) egg-shaped, compressed, 2-edged. *Style* (see fig. 3, b. & fig. 6.) 1, terminal, cylindrical, curved outwards. *Stigmas* 2, thread-shaped, pointed, curved. *Fruit* (see fig. 8.) a bladder-like *drupe* or *utricule*, cylindrical, pointed, somewhat juicy, 1-celled, without valves, 1-seeded. *Seed* (see fig. 9.) oval, striated. *Embryo* (see fig. 10.) central, cylindrical, curved. *Radicle* inferior, (that is, opposite to the scar of the seed).

Distinguished from other genera in the same class and order, by the two kinds of flowers being inserted, in two rows, upon one side of a common *spadix*, and both destitute of calyx and corolla; by the leaf-like *spatha*; and by the sessile *anther*.

One species British.

ZOSTE'RA MARINA. Sea Grass-wrack. Common Grass-wrack.

**SPEC. CHAR.** Stem roundish. Leaves strap-shaped, entire, somewhat 3-nerved.

HOOKER's beautiful plate in *Flora Londinensis*.

\* From *zoster*, Gr. a *girdle*, or *ribbon*; which the leaves somewhat resemble.

† See fol. 83, note †.      ‡ See fol. 49, note †.      § See fol. 350, a.

**LOCALITIES.**—On the sea-shores, almost everywhere, and in adjacent salt-water ditches.

**Perennial.—Flowers through the Summer.**

*Root* fibrous. *Stem* from 2 to 3 feet long, floating under water, round, smooth, decumbent at the base, jointed, the joints throwing out roots, upper part upright, leafy. *Leaves* alternate, from 4 to 8 inches or more long, and 2 or 3 lines wide, strap-shaped, bright green, grass-like, floating, smooth, entire, blunt at the extremity, much sheathing at the base, and throughout the whole length more or less distinctly 3-nerved, the nerves connected by transverse veins. *Flowers* quite destitute of both calyx and corolla, and inserted in 2 longitudinal lines on the superior surface of a long, strap-shaped, somewhat succulent, cellulose *spadix*, arising from a sheathing portion of a leaf, which thus forms the *spatha*. *Pistils* and *Anthers* alternate, generally 2 *anthers*, and then 1 pistil; both egg-shaped, or oblong-egg-shaped (see fig. 3, *a & b.* and figs. 4, 5, and 6.), the *germen* tipped with a 2-parted, long, filiform *style*. Both are green. *Anther* bursting irregularly, and discharging an exceedingly minute *pollen*, mixed with pellucid, branched fibres. *Fruit* (fig. 8.) cylindrical, rather succose, smooth, green, at length between membranaceous and horny, when dry striated, often ending in a beak by means of a portion of the style and stigmas. See HOOKER'S *Fl. Lond.*

Whole plant variable in size. The large variety, fig. 2. is found on the coast of Scotland, but never, I believe, in flower. Sir J. E. SMITH says, “*Zostera* is easiest understood, as a simple unilateral spike of naked flowers disposed in two ranks.”

It is thrown on the shore by the tide, in great plenty, and mounds or walls are built with it to oppose the encroachment of the sea. Exposure to the weather bleaches it white. Buildings are thatched with the green leaves, which will endure upwards of a century. It is used by the inhabitants of Gothland, in Sweden, as a manure, and also for stuffing beds; and of late it has been imported in large quantities from the Continent, and is now prepared in this country for stuffing mattresses, and for the other purposes to which horse-hair is in general applied. It is also used for packing glass-bottles, and other brittle ware. PALLAS tells us, that in Russia it is found among Pottery in old tombs.—Horses and swine eat it; cows are not fond of it.

---

The following lines were suggested by the peculiar beauty and curious formation of this plant.

“ More near to the orb of her ardent devotion,  
*Zostera* ascends from the deep coral cave,  
(Where no sun-beams enliven the gloom of the ocean,)  
To float in the splendour that lights up the wave.

How sweetly she blooms on the calm swelling billow,  
While the sun's parting glory illuminates the west:  
And though fitful and wild is that treacherous pillow,  
Its rockings but waft to an haven of rest.

So grant that our thoughts, on the wings of devotion,  
May rise from the depth of affliction to Thee;  
O, Thou! who canst silence the waves of the ocean,  
The dark rolling billows of life's stormy sea!

Then weep not, poor pilgrim, though startled from slumber,  
And vanish'd the dreams that once render'd thee blest;  
Peace divine, a sure pilot, o'er waves without number,  
Will guide thy frail bark to an haven of rest.”

\* From *melas*, Gr. *bleak*; and *pyros*, Gr. *wheat*; from the seeds resembling grains of wheat.      † See fol. 31, note †.      ‡ See fol. 72, note ‡.

§ Differs from *Scrophularineæ* in the capsule being 2, not many, seed d.

**LOCALITIES.**—In corn-fields, and on dry gravelly banks; rare.—*Cheshire*: On a hill at Horsley Bath; near Beeston Castle: Mr. VERNON, in *Blackst. Sp. Bot.*—*Dorset*; In Bere Field; observed for two years, but afterwards lost: Dr. PULTNEY, in *Gloucestersh.* Corn-fields near Gloucester: G. S. WINTLE, in N. B. G.—*Hants*; In corn-fields between Sheephill and St. Lawrence, where, as well as on steep banks, and even in woods, but particularly among corn, it grows in far too great a degree of abundance, and is gradually encroaching on the wheat-fields all along the Undercliff from Niton even to Bonchurch, Isle of Wight: Dr. W. A. BROMFIELD.—*Norfolk*; In the corn on the right hand just before you come to Lyham: Mr. J. SHEPPARD, in *Ray's Syn.* In Wessenden corn-fields: Mr. HILL, in *Black. Sp. Bot.*—Once found in Barton Bendish: Rev. R. FORBY. In the common field at Spore, especially among wheat: Rev. J. S. WATTS. At Costesey and Bixley, near Norwich: Mr. PITCHFORD. At Swardeston and Keswick, near Norwich: Mr. CROW.—*Warwicksh.* Packington: COUNTESS OF AYLESFORD.

**Annual.**—Flowers in July.

*Root* tapering, fibrous. *Stem* upright, from 6 inches to a foot or more high, bluntly 4-cornered, much branched, often purplish, clothed with very short, deflexed hairs, leafy. *Leaves* opposite, nearly sessile, spear-shaped, pointed, one or two of the upper pairs usually with several long, spear-shaped, pointed teeth, at the base; all rough with very short, bristly hairs. *Spikes* conical, gradually lengthening out, many-flowered. *Bracteas* (see fig. 1.) loosely spreading, deeply pectinated or pinnatifid; the upper ones entirely, and the lower ones partially, coloured of a delicate purplish rose-colour. *Flowers* large, about as long as the bracteas. Segments of the *calyx* very long and slender, sharp-pointed, coloured like the bracteas, and rough with short blunt hairs. *Coroilla* (fig. 3.) a little longer than the segments of the calyx, rough with short hairs; tube dilated at the base and throat, narrow and curved in the middle; lips closed, upper one very obtuse, and beautifully fringed at the margin; lower ones nearly flat, channelled on the upper side, with a prominent rib on the lower, very slightly 3-cleft; variegated with yellow, rose-colour, and purple. *Filaments* 4, fringed with hairs. *Anthers* incumbent, combined. *Germen* egg-shaped. *Style* slender, longer than the stamens, curved at the summit. *Stigma* small, blunt. *Seeds* large, resembling grains of wheat, 2 in each cell, though often by abortion only one.

It is a beautiful plant, and would be an ornament to the flower-garden, was it not—like other species of the genus—very shy of cultivation. It is a bad weed to the farmer, especially when it abounds among wheat. Dr. BROMFIELD informs me, that “the value of the wheat on certain farms, in land behind St. Lawrence,” in the Isle of Wight, “is greatly lowered from the admixture of the seeds, which cannot be separated from the grain by winnowing, the specific gravity of both being nearly the same; these seeds impart a bluish colour to the flour, and give it, when made into bread, a hot and unpleasant flavour, which must be anything but wholesome to those who make use of it.” The plant is well known in the neighbourhood as the *Poverty-weed*, and various traditions are afloat as to the manner of its introduction to this island, which however is not of very recent date, the species having existed in some of its present stations for at least 40 years, and is by some supposed to have come over from Jersey, where, however, it is not known at present as indigenous, or even naturalized. Others conjecture that it may have been imported from Spain, but these suppositions are entirely gratuitous, appearing to have no foundation in fact. The probability is, we are indebted for this unwelcome, though splendid addition to our flora, [of the Isle of Wight] to an importation of seed-wheat from Norfolk, or some other maritime county, where, as in this island, it infests only such corn lands as lie over chalk, or contain a large proportion of calcareous earth.”

Cows and goats are said to eat this plant; sheep to refuse it.

For the specimen figured, as well as for the above interesting information, I am indebted to the kindness of Dr. W. A. BROMFIELD, of Ryde, in the Isle of Wight, who is now preparing a Flora of that Island.

LOCALITIES.—In cultivated fields and their borders, and in waste places; scarcely wild.

### Biennial.—Flowers in April.

*Root* orbicular (see fig. 11.) mostly depressed, in one variety oblong, always succulent, white, or tinged with purple, varying greatly in size, according to the soil in which it grows; tapering and fibrous at the base. *Stem* from 1 to 3 feet high, upright, branched, leafy, cylindrical, smooth. *Root-leaves* abundant the first season, withering as the stem arises, petiolate, spreading, large, lyrate, jagged, deep green, not glaucous, veiny, rough with small sharp bristly hairs; the terminal lobe large, roundish; all widely toothed. *Stem-leaves*, lower ones more simple, smoother, clasping at the base; upper ones small, quite entire, glaucous, smooth. *Flowers* yellow, numerous, in loose, corymbose tufts. *Calyx* spreading considerably in the upper part, though not at the base. *Petals* roundish, inversely egg-shaped, with upright, channelled claws. *Pod (siliquæ)* nearly upright, cylindrical, veiny, smooth, with a tapering barren beak (see fig. 6). *Seeds* globose, of a reddish-brown colour.

BRYANT observes, in his *Flora Diætetica*, p 26, that "no plant exhibits a more striking instance of the benefits of cultivation than this, for in its wild state it is worth little to man or beast; but under the management of the husbandman it not only affords food for the human species, but becomes a most advantageous crop to the cultivator, by furnishing the principal winter food for his cattle."—Before the introduction of potatoes, turnips (in a cultivated state) were of great consequence to the poor of this island. In Wales, a few years since, they formed a considerable portion of the food of the lower classes; and the use of the root, boiled and mashed as a dish, in broths, soups, and stews, or entire, is familiar over all Europe. The juice of the root, well fermented, affords by distillation an aident spirit, and may be made into an inferior sort of cyder. The rind is acrimonious. This root is also much used in decorating tongues, hams, stewed beef, &c., being cut into roses, and other devices. The top shoots from such as have stood the winter, are gathered whilst tender, and dressed as spring greens or spinach, and are called *Turnip-tops*. The seed is also sometimes sown as small salading. But the greatest use of Turnips is in feeding oxen, and more especially sheep, in winter. Turnips were used by the ancients to recover frozen or benumbed feet, being first boiled in water, and then applied as a fomentation. The root, pounded in a mortar with salt, was also esteemed a remedy for all diseases of the feet, such as corns, swellings from cold, &c. GUILILM says Turnips were used in armorial bearings, to represent a person of good disposition, who relieved the poor.

For an account of the most approved methods of cultivating this very useful vegetable, both in the garden and in the field, see DON's *Gen. Syst. of Gard. and Bot.*; LOUDON'S *Encycl. of Gard.*; MARTYN'S *Mill. Gard. Dict.*; and BAXTER'S *Lib. of Agricul. and Horticul. Knowledge*.

## CAU'CALIS\*.

*Linnean Class and Order.* PENTA'NDRIA †, DIGY'NIA.

*Natural Order.* UMBELLIFER.E ‡, Juss. Gen. Pl. p. 218.—Sm. Gram. of Bot. p. 132.—Lindl. Syn. p. 111.; Introd. to Nat. Syst. of Bot. p. 4.—Rich. by Macgilliv. p. 463.—Loud. Hort. Brit. p. 517.—Don's Gen. Syst. of Gard. and Bot. v. iii. p. 235.—Mack. F. Hibern. p. 113.—UMBELLATE, Linn.—ROSALES; sect. ANGELICINÆ; type, ANGELICACE; subtype, CAUCALIDÆ; Burn. Outl. of Bot. v. ii. pp. 614, 770, 773, & 781.

**GEN. CHAR.** *Flowers* imperfectly separated, irregular; the outermost fertile. *Calyx* (see fig. 2.) superior, of 5 broad, acute, unequal, permanent teeth. *Corolla* (fig. 1.) of 5 more or less unequal, inversely heart-shaped petals, with a strongly inflexed point, the lobes of each almost equal. *Filaments* awl-shaped, shorter than the corolla. *Anthers* roundish. *Germen* (see fig. 2.) inferior, oblong, bristly. *Floral Receptacle* obsolete. *Styles* (see fig. 2.) awl-shaped, slightly spreading, much shorter than the corolla, tumid, and somewhat pyramidal at the base, permanent. *Stigmas* blunt, oblique, *Fruit* (see figs. 2 & 4.) elliptic-oblong, slightly laterally compressed, tumid. *Carpe's* (see figs. 3 & 5.) with the 5 primary ridges filiform, bristly, or with little prickles; of these the 3 middle ones are dorsal, the 2 lateral on the inner face; the 4 secondary ridges more prominent, armed with prickles, in one or two rows. *Chamels* (*intersticis*) under the second ridges with single *vitta* (see fig. 5). *Seed* involute, or inflexed at the edge. *Involucrum* many-leaved. *Flowers* white or pink.

The 5-toothed *calyx*; the slightly laterally compressed, beakless *fruit*; the *carpels* with 5 primary bristly ridges, of which the 3 middle ones are dorsal, and the 2 lateral ones on the inner face (or plane of the commissure); and the secondary ridges with hooked prickles, and single *vitta*; will distinguish this from other genera in the same class and order.

Two species British.

**CAU'CALIS DAUCOI'DES.** Carrot-like Hen's-foot. Small Bur-parsley.

**SPEC. CHAR.** Leaves twice or thrice pinnatifid; segments short. Umbels of 3 rays. Involucrum none. Involucels 3-leaved. Umbellules ripening about 3 fruits.

**LOCALITIES.**—In corn-fields, on a chalky soil.—*Oxfordsh.* Between Middleton Stony and Bucknel: Dr. SIBTHORP.—*Berks.*; Near Reading: Mr. FARDON.—*Beds*; Oakley West Field, discovered by Mr. JAMES PAYNE, a discerning Herbalist of that village: Rev. C. ABBOT.—*Cambridgesh.* Among the wheat, on the left-hand side of the road leading from Cambridge to Gogmagog Hills, between the second and third milestone; Kingston; Devil's Ditch; Anglesey: Rev. R. RELHAN. Very scarce, having only been found, of late years, near Swaffham Prior and Burnwell: C. C. BABINGTON, in N. B. G.—*Durham*; In fields on Fulwell Hills near Sunderland, its most northern locality. Fields near Whitburn: N. J. WINCH, Esq. In corn-fields near Norton: J. HOGG, Esq.—*Kent*; About Dartford: Mr. Woods, jun.—*Lincolnsh.* Carlby, between Stamford and Bourn: Mr. WOODWARD.—*Norfolk*; Corn-fields at Matham: Mr. CROW.—*Northamptonsh.* Near a limestone-pit at Denshanger, copiously: *Hist. Sometsesh.* Corn-fields about Charlton Adam, Somerton: Dr. GAPPER. Odd Down or Burnt-house Gate, in corn: Dr. DAVIDS. Corn-fields on Kingsdown: Mr. C. E. BROOME.—*Suffolk*; Great Saxham, near Bury: Sir T. G. CULLUM. Newmarket: N. J. WINCH, Esq.—*Surrey*; Among the corn by the side of the road from Banstead to Dorking: MARTYN. Near Boxhill: Mr. J. Woods, jun. In corn-fields on the south side of the Chalk Downs about two miles west of Dorking, above Westcote-street: Mr. E. JENNER.—*Warwicksh.* Alne Hills in corn-fields: RUFFORD. Fields about Drayton Bushes: T. PURTON, Esq.—*Yorksh.* Corn-fields near Malton, and Thorp Arch: TESDALE. Above Barton, and Appleton near Malton: Rev. ARCHDEACON PIERSON. Near Ripon: Mr. BRUNTON. Ploughing fields near Thornborough Moor, between the villages of Thornborough and Tanfield: Rev. J. DALTON. Kippax; Roche Abbey; Knaresbro'; Hildenley Wood; and near Whitwell: Mr. BAINES.

#### Annual.—Flowers in June.

*Root* small, tapering. *Stem* from 6 inches to a foot or 18 inches high, deeply furrowed, nearly smooth, except the joints, which are hairy. *Leaves* extremely elegant, on short membranous-edged foot-stalks; 3-cleft at the base, then thrice compounded, clothed more or less with very narrow, deep-green segments; nearly smooth on the upper surface, the lower with scattered, white, bristly hairs. *Umbel* of 3 or 4 stout, 4-cornered, spreading rays, without an involucrum, or with rarely a small solitary *bractea*. *Umbellules* of 2 or 4 fertile *flowers*, with several sterile ones. *Involucels* of from 3 to 5 spear-shaped, spreading leaves, not membranous. *Calyx* very obvious. *Petals* generally reddish, but slightly radiant (see fig. 1). *Fruit* large, oblong, very prickly, with long, whitish, hooked bristles, in distinct rows; rarely more than three fruits in each umbellule attain perfection.

This is a low bushy plant, a native of Middle and South Europe, even to Tauria, Caucasus, and Persia, in corn-fields on a chalky soil. It appears not to have been found in Wales, Scotland, or Ireland.

For the specimen from which the drawing for the accompanying plate was made, I am indebted to my kind friend Mr. E. JENNER, of Lewes, Sussex.

Reservoir, Charnwood Forest; also near the new Church.—*Middlesex*; Old walls in the King's Road, Chelsea.—*Norfolk*; Stanhoe; S. Denes.—*Notts*; Abundant in the neighbourhood of Nottingham.—*Shropshire*; Hawkestone; and near Oswestry.—*Somersetshire*; By the roadside at Hinton.—*Staffordshire*; Litchfield Race-ground.—*Suffolk*; Bungay.—*Surrey*; Abundant on sandy commons; on Wimbledon Common; Wandsworth Common; Clapham Common; Battersea Fields; Barnes Common; about Mousley; and on Reigate Heath.—*Sussex*; Ashdown Forest.—*Warwickshire*; Coleshill Heath; Corby Moor, and other like places.—*Worcestershire*; On the Malvern Hills, as high as 800 feet; N. Hill, Malvern.—*Yorkshire*; Near Rotherham.—**WALES.** *Anglesea*; Near Beaumaris, thinly scattered; on rocks sparingly covered with earth in Llandegfan; and on a common called Rhos cefn hir, Pentraeth.—*Caernarvonshire*; Banks and hilly pastures about Bangor.—*Montgomeryshire*; Foot, and top of Breiddon Hill, near Rodney's Pillar (1199 feet).—**SCOTLAND.** In pastures, on a gravelly soil.—Not in the *Flora of IRELAND*.

For authorities, see WATSON's *New Botanist's Guide*, and the *Floras of the respective counties*.

**Annual.**—Flowers in April and May.

**Root** small, fibrous. **Stems** usually several, from 2 to 4 inches high, upright, or slightly reclining at the base, round, smooth, leafy. **Leaves** opposite, sessile, strap-spear-shaped, acute, entire, rigid, single-ribbed, glaucous. **Flowers** upright, solitary, on long terminal peduncles. **Sepals** (see fig. 1.) large, elliptic-spear-shaped, pointed, upright, converging, white and membranous at the edges, permanent. **Petals** (see fig. 2.) white, spear-shaped, entire, about as long as the sepals, withering. **Capsule** (see fig. 5.) of a light shining brown. **Seeds** (see figs. 7 & 8.) numerous, of an orange-brown colour, minutely tuberculated.

Whole plant of a somewhat glaucous colour, and quite smooth. In dry ground the stem is often simple; but if the situation where it grows be moist, it throws out many stems, which at first recline on the ground, but afterwards become upright. The calyx never opens far, so that the corolla is not suffered fully to expand.

*Cirsium strumarium. Small Burdock. ♂*

**Annual.**—Flowers in August and September.

*Root fibrous. Stem* solitary, upright, from one to two feet high, branched, leafy, furrowed, solid, downy. *Leaves* alternate, on long petioles, heart-shaped, lobed, cut, and doubly serrated; nearly four inches long, and two or three inches wide; with three principal nerves at the base, minutely downy all over; dark green on the upper surface, paler underneath. *Racemes* axillary, leafy, few-flowered. *Sterile Flowers* one or two on each raceme; *anthers* separate, not united as in the class Syngenesia. *Fertile Flowers* four or five on each raceme, immediately beneath the *sterile ones*; all green. *Involucrum* of the fertile flowers (see fig. 3.) oblong, coriaceous, prickly, divided by a longitudinal partition (see fig. 4.), ending at top in two beaks, which at first are straight, but afterwards curved inwards and hooked, gaping in the inner side by a longitudinal cleft, but not splitting. *Fruit* (see fig. 2.) 1-seeded, dark brown, enclosed in the enlarged and hardened involucrum. *Seeds* (figs. 5 & 6.) oblong, attenuated at each end, striated, convex on one side, flat on the other.

This is “a rank, weed-like plant,” very rarely to be met with in a wild state in England; most of the localities given above being doubtful ones. It is, however, said to be more common in some other parts of Europe; and also in Africa about Algiers; and in China and Cochinchina, in fields and hedges.

The leaves are bitter and astringent, and were formerly in repute for the cure of scrophulous disorders, to which the specific name alludes. A decoction of the whole plant affords a showy yellow colour; but it is better if only the flowers are used. Horses and goats eat it; cows, sheep, and swine refuse it. The seeds are said to be the favourite food of the Carolina Parrot, or Parquet.

The drawing for the accompanying plate was made from a well preserved specimen in the Sherardian Herbarium. The sections are from *English Botany*, and from GÄRTNER's *De Fructibus et Seminibus Plantarum*, t. 164. f. 9.

## PA'NICUM \*.

*Linnean Class and Order.* TRIA'NDRIA †, DIGY'NIA.

*Natural Order.* GRAMI'NEA, Juss. Gen. Pl. p. 28.—Sm. Gram. of Bot. p. 68.; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293.; Introd. to Nat. Syst. of Bot. p. 292.—Loud. Hort. Brit. p. 542.—Mack. Fl. Hibern. p. 294.—Hook. Brit. Fl. (4th ed.) p. 426.—GRAMINA, Linn.—Rich. by Macgill. p. 393.—GRAMINALES; sect. PANICINÆ; type, MILIACEÆ; Burn. Outl. of Bot. v. i. pp. 359 & 366.

**GEN. CHAR.** *Panicle* spiked; spikes compound. *Calyx* (see figs. 2 & 3.) 2-flowered, of 2 unequal glumes, the outer glume minute, (see fig. 1.) sometimes obsolete; the inner much larger, concave, mucronate or awned (see figs. 2 & 3). *Florets* dissimilar; *outer* with *anthers* only, or *neuter*, (see fig. 4), with 1 or 2 paleæ, outer palea with the texture of the calyx, ribbed, more or less awned; *inner floret* perfect, of 2 paleæ, cartilagenous, enveloping and somewhat adhering to the *fruit*. *Filaments* (see fig. 5.) 3, hair-like, as long as the corolla. *Anthers* short, cloven at each end. *Germen* (see fig. 5.) egg-shaped. *Styles* (see fig. 5.) 2, distinct, awl-shaped, as long as the stamens. *Stigmas* feathery, tufted, short. *Seed* (see figs. 9 & 10.) somewhat egg-shaped, flattened on one side, coated with the hardened corolla (see figs. 6, 7, and 8).

The compound spike-like *panicle*, without bristly *involucrums*; the *calyx* of 2 unequal glumes, containing 2 florets, one of which is *neuter*, or has *anthers* only; and the other perfect, of 2 cartilaginous *paleæ* (*valves*) which envelope, and somewhat adhere to, the fruit; will distinguish this from other genera in the same class and order.

The absence of the bristly involucrum at the base of the spikelets will distinguish this genus from that of *Setaria*, (see t. 211. f. 2).

One species British.

PA'NICUM CRUS-GALLI. Cock's-foot Panick-grass. Loose Panick-grass,

**SPEC. CHAR.** Spikes alternate, secund, divided or simple. Florets imbricated, the calyx, and outer valve of the corolla of the neuter floret hispid, awned, or mucronated; inner valve (palea) of the perfect floret with a hispid mucro. Rachis hispid. **HOOKER.**

**LOCALITIES.**—In moist arable land; very rare.—*Essex*; In a coppice near Purfleet: Dr. MILN.—*Hants*; By a rivulet side near Petersfield: Mr. GOODYER, in *Merr. Pin.* p. 56.—*Kent*; THOMAS WILLISELL found it in Mr. BLESSETT's garden between Deptford and Greenwich: RAY (1690).—*Middlesex*; In a lane by the Neat-house Gardens, Chelsea: Ray's Syn. (3rd ed.) p. 394.—*Surrey*; In moist places about Battersea and Putney: Rev. J. LIGHTFOOT.—Battersea Fields, in abundance; 1831: Mr. W. PAMPLIN, jun. About Martha's Chapel near Guildford: HUDSON.

### Annual.—Flowers in July.

**Root** fibrous. **Culms** (*stems*) several, at first procumbent, finally almost upright, from 1 to 2 feet high, stout, leafy, jointed, smooth, with some tufts of radical leaves, and a few short, more spreading, stems, at their base. **Leaves** harsh, pointed, neither warty nor hairy, rough at the margins. **Stipulas** none. **Sheaths** large, compressed, striated, smooth. **Panicle** upright, rigid, composed of many unilateral, spike-like branches, of which the lower ones are rather distant, the upper crowded; all with tufts of fine smooth bristles, originating in tubercles, at their base. Larger glume of the **calyx** (see figs. 2 and 3.) egg-shaped, concave, ribbed, bristly, pointed, or slightly awned; smaller glume (see fig. 1.) cup-shaped, embracing the whole base of the flower. Perfect **floret** of 2, egg-shaped, awnless valves (*paleæ*), very smooth and even, finally horny, coating the seed; the larger concave, obscurely ribbed; the inner smaller, flattish. Neuter **floret** of 2 very dissimilar valves (*paleæ*); the outermost resembling the outer glume of the calyx, concave, ribbed, bristly, inflexed at the edges, and terminating in a rough, straight awn, generally short, as in the specimen figured, but sometimes very long, as in LEERS' fig. 3, in t. 2., and MORISON'S fig. 16.; the innermost rather smaller, thinner, flat, notched at the tip (see fig. 4). **Stamens** and **Pistils** (see fig. 5.) in the perfect flowers only, about as long as the corolla. **Filaments** hair-like. **Anthers** cloven at each end, purplish. **Germen** (see fig. 5.) roundish. **Styles** very short. **Stigmas** feathered, and purplish. **Seed** rather large, shining, coated with the valves of the corolla, round on one side, and flat on the other, figs. 6, 7, 8. Figs. 9 and 10, represent the seed when taken from its covering. See *Sm. Engl. Fl.*; *Curt. Fl. Lond.*, &c.

*Panicum Crus-galli* is a native of Virginia, the Cape of Good Hope, and several parts of Europe, as Sweden, Germany, Switzerland, the South of France, and England. It produces abundance of rather large seeds, which are acceptable to small birds. Though not hitherto cultivated, SALISBURY says it possesses qualities which render it worth attention. It stands dry weather better than most other grasses, will attain the height of four feet, and is not disagreeable to cattle.

*Azalea procumbens. Trailing Azalea. 5*

Ben Hope, and Ben Heeal: Mr. H. C. WATSON.

**Shrub.**—Flowers from April to July.

*Root* woody, branching, fibrous. *Stems* dwarfish, woody, rigid, tortuous, round, darkish-brown, and naked below, leafy above, very much branched; branches crowded, leafy, each 2 or 3 inches long, depressed, spreading in all directions. *Leaves* numerous, small, opposite, on very short, somewhat dilated petioles, oval, entire, very much resembling those of *Thyme* (t. 127), quite smooth, glossy, dark-green, channelled on the upper surface, with the margins remarkably revolute, so as almost to meet the thick, broad, prominent midrib of the under surface, which is paler. *Flowers* small, in short terminal *racemes*. *Pedicels* (see fig. 1.) smooth, red, each with an egg-shaped *bractea* at its base, swollen upwards. *Calyx* (see fig. 1.) purple, permanent, in 5 deep, oblong, fleshy segments. *Corolla* rose-coloured, in 5 oblong, bluntnish, moderately spreading segments. *Stamens* inserted upon a fleshy disk or base to the germen, a little shorter than the corolla; *anthers* (see fig. 4.) of 2 oval cells, opening by a longitudinal fissure. *Germen* (see fig. 5.) on a fleshy base or disk, egg-shaped, 2- or 3-celled. *Capsule* (see fig. 6 to 9.) broadly egg-shaped, purplish-brown, with a spongy coat, and deciduous cuticle; opening by 2 or 3 valves, according as the cells are 2 or 3. *Seeds* (see figs. 10 to 13) oval, pale brown, dotted, fixed to the lobes of a central, at length, (when the valves open,) free column or receptacle. See *Hook. Brit. Fl.*

Authors differ in opinion respecting the number of valves and cells which compose the capsules of this species. GERTNER found but 2, or more commonly 3, cells to the capsule, never 5; and his observations are confirmed by those of Sir W. J. HOOKER. LINNEUS describes them (*Tour in Lapland*, v. i. p. 285.) as having 5 cells and 5 valves; and Sir J. E. SMITH says (*Engl. Fl.* v. i. p. 282), that he found 4 or 5. The capsules of some specimens of *Azalea procumbens*, in the *Sherardian Herbarium*, appear, some to have 4, and others 5 valves, but, on a close inspection of them, I found the former were only 2, and the latter only 3-celled; each valve being divided so far down as to look like two.

This interesting and elegant little shrub, which is so plentiful on the tops of many of the mountains in Scotland, has not, I believe, been found either in England or Ireland. It is said to abound in the Arctic Regions, and throughout the whole of the northern hemisphere. In North America, it is found wild in the alpine regions of the White Mountains, New Hampshire; and on Grand-father Mountain, Carolina, &c.

For the specimen figured, I am indebted to Mr. W. JACKSON, jun. of Dundee, who gathered it on the Clova Mountains, in July, 1840.

\* From *anthericos*, Gr.; applied by the Greeks to the stem of the *Asphodel*. HOOKER.

† See fol. 33, note †.      ‡ See fol. 41, a.      § See fol. 33, note †.

|| The specific name, which is incorrect for a plant blossoming in June, (MARTYN says April and May,) seems to have originated in a confusion of synonyms between this *Anthericum* and the *Narcissus serotinus* of Clus. Hist. v. i. p. 162, the figure in which is copied in JOHN BAUHIN'S Historia, and there placed with our *Anthericum*. Sir J. E. SMITH.

**LOCALITIES.**—On the loftiest Welsh mountains.—*Caernarvonsh.* On Snowdon; and on the mountains in the neighbourhood of Llanberries; on the west side of Trigvilchau: RAY. Abundant on rocks above Twll-dû: I have also found it in one place only on the rocks of Crib y Ddescil, but could never find it on Clogwyn ddû'r Arddû: Mr. GRIFFITH in B. G. On Clogwyn ddû's Arddû: Rev. H. DAVIES, ibid. Rocks near Twll-dû: J. E. BOWMAN, in N. B. G. Near the summit of Glydyr Fawr: Mr. W. WILSON, in Brit. Fl. Just coming into flower, May 30, 1828, on rocks close to the chasm called Twll Du on Cwm Idwal: N. J. WINCH, Esq., in *Loud. Mag. Nat. Hist.* v. ii. p. 279.

**Perennial.**—Flowers in June.

*Root* somewhat tuberous, rather than bulbous, with many long slender fibres. *Stem* solitary, from 3 to 6 inches high, round, generally simple and single-flowered, rarely 2-flowered. *Root-leaves* few, upright, semicylindrical, solid, very slender, often longer than the stem. *Stem-leaves* 3 or 4, much shorter than the root-leaves, spear-awl-shaped, sheathing, scattered, and more resembling *bracteas* than leaves. *Flowers* upright, usually one only, very rarely more. *Petals* scarcely half an inch long, tapering at the base, white, veined externally with dull red, withering, permanent, as well as the *stamens*. *Filaments* beardless, not attached to the petals. *Germen* (see fig. 2.) obscurely triangular. *Stigma* triangular, truncated. *Capsule* the size of a pea, membranous. *Seeds* angular, wrinkled, of a bright chesnut colour (*Sm. Eng. Fl.*). Mr. W. WILSON (in HOOKER'S *British Flora*) says, the *flower-stalk* is invested with its own sheath, and separated by an elongation of the *root* from the *leaves*, of which the most distant encloses within its fleshy base the rudiment of the plant of the following season. The same excellent Botanist also observes, that the plant is increased by offsets or creeping shoots with a bulb at the extremity, the point of the bulb directed towards the parent root. Sir J. E. SMITH says he could not perceive the black brittle *skin* on the seeds of this plant, which is proper, as Mr. BROWN observes, to his *Asphodelææ*.

*Anthéricum serótinum* is a smooth, slender plant, growing only on high mountains in Switzerland, Dauphinè, Piedmont, Austria, &c. In Britain it has been found only on some of the loftiest mountains in Wales.

---

#### S P R I N G.

How shall I woo thee, beautiful Spring ?

What shall my offering be ?

Shall I search the abode of the Ocean King,

And a chaplet of pearls bring thee ?

Oh, no ! for there shines in thy clustering curls  
The dew-drops of morning brighter than pearls.

Shall I seek the sweet South, where the balmy breeze

Kisses lightly the cheek of her flowers ?

Shall I bring them to thee with their perfumed leaves,

And plant them within thy bower ?

Oh, no ! for the violet that blooms at thy feet  
Has a lovelier glow, and a breath more sweet.

How shall I woo thee, beautiful Spring ?

From whence shall my offering come ?

Shall I echo the birds as they joyously sing

In the groves of thy flowering home ?

Oh, yes ! for sweet music alone has the spell  
To fathom the depths of thy leafy dell.

A. C. TURNBULL.

**GEN. CHAR.** *Flowers* monœcious, collected into a compact, scaly head. *Scales* (see fig. 1.) 1-flowered, the exterior ones generally empty, and forming an involucrum. *Sterile Flowers* (see fig. 2.) in the centre. *Calyx* of 2 or 3 sepals. *Corolla* of 2 or 3 petals, united nearly to their summit. *Filaments* (see fig. 2.) 4 or 6, occasionally 3, from the upper part of the petals (see fig. 3), and a little longer, thread-shaped, upright. *Anthers* roundish, of 2 oblong cells. *Fertile Flowers* (see figs. 4 & 5.) in the circumference. *Calyx* (see fig. 4. d, d.) of 2 or 3 sepals. *Corolla* (see fig. 4. c. and fig. 5.) of 2 or 3 distinct petals. *Germen* (see fig. 7.) 2- or 3-lobed, superior. *Style* 1, very short. *Stigmas* 2 or 3, awl-shaped, pointed. *Capsules* (see fig. 8.) with 2 or 3 rounded lobes, and as many cells, bursting at the angles. *Cells* 1-seeded. *Seeds* (see fig. 9.) globular, albuminous, with an external embryo.

The compact head of flowers, with a scaly *involucrum*; the *sterile-flowers* in the centre, each with a *calyx* of 2 or 3 sepals, and a *corolla* of 2 or 3 petals connected nearly to the summit; the *fertile-flowers* in the circumference, each with a *calyx* of 2 or 3 sepals, and a *corolla* of 2 or 3 distinct petals; the single *style*, with 2 or 3 *stigmas*; and the *capsule* with 2 or 3 lobes, and 2 or 3, single-seeded, cells; will distinguish this from other genera in the same class and order.

One species British.

**ERIOCAULON SEPTANGULA'RE.** Seven-angled Pipewort. Jointed Pipewort. Wreathed Pipewort. Net-wort.

**SPEC. CHAR.** Scapes striated, about 7-angled, longer than the cellular, compressed, awl-shaped, smooth leaves. Head of Flowers convex. Sepals, Petals, and Scales, hairy at the extremities. Stamens four. Capsule 2-celled.

A Petal of ditto, with 2 tubercles.—Fig. 7. Germen.—Fig. 8. Capsule.—Fig. 9. A Seed.—All magnified; fig. 9. very highly so.

\* From *erion*, Gr. *wool*; and *kaulos*, Gr. a *stem*; in allusion to the downy stems of the species first known, though not applicable to the British one.

† See folio 83, note †.

‡ See folio 92, note †.

**LOCALITIES.**—In Lakes in Scotland and the west coast of Ireland; rare.—  
**SCOTLAND.** *Inverness-shire*; First observed in the isle of Skye by Mr. ROBERTSON, in 1768, according to Dr. HOPE; but by the Rev. Dr. WALKER's Herbarium, in Mr. MAUGHAN's possession, it appears to have been discovered there, Sept. 11, 1764, by Sir JOHN MACPHERSON, along with Dr. WALKER, in a small lake by the road-side leading from Sconser to Giesto. Sir JOHN MACPHERSON, who saw it first, leaped from his horse, waded into the lake, and brought it out. See HOOKER'S *Fl. Scot.* In two or three small fresh-water lochs, about a mile west of Loch-Sligachan, in the isle of Skye, but particularly in a small lake called Loch-na-Caiplich, close to the road-side between Sligachan and Drynoch, in such abundance that the white fibres of the roots are thrown upon the edges of the loch in the same manner as wrack and other weeds on the sea-shores: *LIGHTFOOT*. In Skye, Coll, and a few of the neighbouring islands of the Hebrides; Sir W. J. HOOKER.—**IRELAND.** On the edges of all the loughs, great and small, in Cunnahara; and it is to be met with in many places in the *county of Galway*: Dr. WADE; see *Memor of Sir J. E. SMITH*, v. ii. p. 148. Very plentiful in many of the small lakes in Cunnahara; and in small ditches within four miles of Galway on the Oughterard road, and in several small lakes between Newport and Mount Nephin, *county of Mayo*: Mr. J. T. MACKAY. Abundant in the lakes of Rosses, *Donegal*: E. MURPHY, Esq.

### Perennial.—Flowers in August and September.

*Roots* creeping, with numerous, long, white, curiously jointed *fibre*s, which penetrate deep into the mud. *Leaves* radical, numerous, channelled, smooth, two or three inches long, tapering gradually from a broadish base, to a hair-like point, and so pellucid as when held between the eye and the light to exhibit very distinctly their beautifully cellular internal structure. *Scape* from a few inches to nearly two feet high, with a tubular sheath at the base, solitary, simple, naked, beautifully cellular, a little twisted, having about seven angles, occasionally more or less, with flat interstices. *Flowers* numerous, minute, collected into a compact terminal *head*; each flower with an inversely egg-shaped, membranous, concave *scale* (fig. 1.), nearly as long as itself. *Calyx* of the *Sterile Flowers* (see fig. 2.) of 2 doubly-keeled, purplish sepals; *corolla* of 2 petals, which are white, and united for a great proportion of their length, so as to be 2-lipped at the extremity, each *lip* bearing a *stamen*, and above that a black sessile *gland* (see fig. 3.); and on each side, between the two lips a *stamen*; in the centre between these are two black stalked glands, (probably abortive *styles*). *Calyx* of the *Fertile Flower* (see fig. 4. *d, d.*) similar to that of the sterile one. *Corolla* (see fig. 4. *c.*) of 2 distinct petals, each with a black, sessile gland at the extremity. *Germen* of 2 globose lobes. *Style* short, *stigmas* 2, long, awl-shaped. See Sir W. J. HOOKER'S *Brit. Fl.*

This very curious plant is said to have been found in no other part of the world than in the habitats recorded above. The plants sometimes form large floating islands, by means of their densely matted roots; the heads of flowers and part of the scape alone rising above the water. The root is slightly acrimonious when chewed. *Eriocaulon decangulare* of LINNAEUS, is distinct from this, and has never yet been found wild in any part of Britain.

---

The *Natural Order RESTIACEÆ*, of which the present plant is the only British example, consists of *herbaceous plants* or *under shrubs*, either with simple, narrow *leaves*, or none. The flowers are generally aggregate, in heads or spikes, and are separated by scales (see fig. 1.). The *perianthium* (see figs. 2, 4, & 5.) is inferior, and from 2- to 6-parted, seldom wanting. The *stamens* are definite, from 1 to 6. The *ovary* (see fig. 7.) is 1- or more-celled, each cell with one, pendulous, *ovule*. The *fruit* (see fig. 8.) is capsular or nut-like; and the *seeds* are inverted, and have a lenticular *embryo*, which is outside the albumen, and distant from the hilum.

G.—*SCOTLAND*. *Berwickshire*; In the Holy Island: RAY. On Bamburgh Castle, confined to a small spot: Miss NEVISON, "Fl. of Berw."—*Forfarshire*; Near to the town of Achmithie; and also at the village of Westhaven: Mr. G. DON, in HEADRICK's "Agricul. of Forfarshire," p. 31.—? *Elginshire*; Burghead: G. GORDON, in N. B. G.—*Haddingtonshire*; By the church at Dunbar: Dr. PARSONS, in "Lightf. Fl." Plentifully among the ruins of the Castle at Dunbar, in 1808: Sir W. J. HOOKER, in "Fl. Scot." Guillon Links: Messrs. ARNOTT and STEWART, in "Fl. Edin." Near Luffness, in a neglected field: N. B. G.

### Annual,—Flowers in April and May.

*Root* small, tapering. *Stems* procumbent, branched, square, leafy, from 1 to 2 feet long, their angles beset with small, hooked spines or bristles. *Leaves* alternate, nearly opposite, or sometimes 3 or 4 from nearly the same point of the stem, oblong-spear-shaped, the lower ones petiolate, (stalked,) all clothed with hispid hairs on both surfaces, and having the margin and mid-rib furnished with bristly hairs, which point forwards. *Flowers* small, axillary, solitary, on very short peduncles, which are upright at first, but afterwards curve downwards. *Calyx* (fig. 1.) small, hairy, becoming much larger after flowering (see figs. 2 & 7). *Corolla* (fig. 3 & 4.) with a short, cylindrical, white tube; rounded, blue segments; and white or reddish scales. *Seeds* whitish, finely granulated.

This plant is a native throughout Europe and Siberia, by waysides, hedges, on walls, and among rubbish.—Horses, goats, sheep, and swine are said to eat it; cows are not fond of it.

*Borkhausia fastida. Stinking Borkhausia.* 3

Watson's Del. &c &c

Pub<sup>d</sup> by W. B. Astor Botanic Garden Oxford 1842.

## BORKHA'USIA \*.

*Linn. Class & Order. SYNGENE'SIA †, POLYGA'MIA, E'QUALIS ‡.*

*Natural Order. COMPO'SITÆ §, (Linn.), tribe, CICHORA'CÆ, Lindl. Syn. pp. 140 & 156.; Introd. to Nat. Syst. of Bot. pp. 197 and 201.—Loud. Hort. Brit. pp. 520 & 521.—Mack. Fl. Hibern. pp. 142 & 159.—Hook. Brit. Fl. (4th ed.) p. 410.—CICHORA'CÆ, Juss. Gen. Pl. p. 168.—Sm. Gr. of Bot. p. 120.—SYNANTHE'REÆ, Rich. by Macgilliv. p. 454.—SYRINGALES; subord. ASTEROSÆ; type, CICHORACEÆ; Burn. Outl. of Bot. pp. 900, 901, & 935.*

**GEN. CHAR.** *Involucrum* (*common caly*) (see fig. 1.) double, outermost (fig. 1, a.) of a few short, awl-shaped, deciduous scales, at length ribbed and furrowed (fig. 3); inner (fig. 1, b.) oval, simple, furrowed, permanent, of several, strap-shaped, converging scales. *Corolla* (fig. 2.) compound, of numerous, imbricated, uniform, perfect, strap-shaped, blunt, 5-toothed *florets* (see fig. 4). *Filaments* (see fig. 5.) 5, hair-like, very short. *Anthers* (see fig. 5.) in a cylindrical tube. *Germen* (see fig. 5.) inversely egg-oblong. *Style* (see fig. 5.) thread-shaped, slightly prominent. *Stigmas* 2, spreading *Seed-vessel* none, except the converging, hardened, inner calyx. *Seed* (see fig. 6.) transversely wrinkled, with a long awl-shaped beak. *Pappus* (see fig. 6.) hair-like, copious, stipitate. *Receptacle* (see figs. 7 & 8.) naked, or very slightly hispid, flattish.

The *involucrum* with awl-shaped scales at the base; the transversely wrinkled *seed*, with a long awl-shaped beak; the hairy, stipitate *pappus*; and the naked or very slightly hispid, flattish *receptacle*; will distinguish this from other genera, with uniform strap-shaped florets, in the same class and order.

It differs from *Crepis*, t. 366, in the *pappus* being stipitate, not sessile.

One species British.

**BORKHA'USIA FŒTIDA.** Fetid Borkhausia. Stinking Hawk's-beard. Stinking Castor-weed. Cotton Groundsel.

**LOCALITIES.**—On dry chalky ground; rare.—Cambridgesh. Dry pastures between Little Shelford and Wittleford: Rev. R. REILHAN. Devil's Ditch: HOOKER, in N. B. G.—Durham; Sunderland Ballast Hills: N. J. WINCH, Esq.—Essex; Chalk-pits at Purfleet: Mr. E. FOSTER, jun.—Kent; Charlton Chalk-pits: PETIVER. Northfleet Chalk-pits: BLACKSTONE. Near Greenhithe: HUDSON. Near Rochester: N. J. WINCH, Esq. Dartford: Mr. JAMES MACNAB, in N. B. G.—Norfolk; Near Swaffham: Mr. PITCHFORD. At Barton Bendish, and Beechamwell, in several places: DAWSON TURNER, Esq.—Northumberland; On St. Anthon's and Willington Ballast-hills: N. J. WINCH, Esq.—Suffolk; About Claydon, and Coddenham: Rev. G. CRABBE. Near the six-milestone from Bury to Newmarket: and at Great Saxham: Sir T. G. CULLUM.—Surrey; Among the corn by the side of the road from Banstead Downs to Dorking: MARTYN. Field behind Juniper Hill, and about old stone-quarries west of Dorking: N. J. WINCH, Esq.—In Sussex: W. BORRER, Esq. N. B. G.

Biennial.—Flowers in June and July.

**Root** spindle-shaped. **Stems** several, spreading, a foot or more high, the central one only being quite upright; all cylindrical, solid, rough with projecting hairs, grooved, leafy, and more or less branched. **Leaves** deeply and unequally pinnatifid, running down into winged and toothed *footstalks*; the terminal lobe large, triangular, acute; side ones broader above, the lowest strap-shaped, a little curved, all toothed, hoary-green, hairy, and rough. **Flowers** several, small, yellow, solitary, on long, furrowed, rough stalks, nodding before they open. **Outer scales** of the involucrum (fig. 1, a.) few, spear-shaped, shrinking as the flower fades; **inner** (fig. 1, b.) strap-shaped, parallel, hairy, and downy, hardened by age, and permanently erect. **Corolla** pale yellow; of a delicate reddish colour underneath. **Seeds** (fig. 6.) tawney, furrowed, very long and slender. **Pappus** (see fig. 6.) simple, roughish, on a long rough stalk. **Receptacle** (see figs. 7 & 8.) furnished with short hairs, fringing its shallow cells.—The whole herb is very milky.

It is remarked by VILLARS, that this plant varies in size, form, colour, and smell; but that in all the varieties the *root* is fusiform (spindle-shaped); the *stem* rough, channelled, and branched; the *leaves* ash-coloured, and more or less indented at the base; that it has commonly the smell of bitter almonds, especially the *involucrum*, when bruised; that the *florets* are red on the outside; the *seeds* fusiform; and the *pappus* on a stipe.

TOURNEFORT and LINNÆUS attribute the smell of bitter almonds to the leaves; HALLER more justly gives the plant a bituminous scent. RAY says that it has a strong scent of Castor; and MARTYN, that the flowers always seemed to him to have the smell of Opium.

It is a native of France, Germany, Switzerland, Austria, and Piedmont, as well as of England. (See *Sm. Engl Fl.*; and *Mart. Mill. Gard. Dict.*)

*Trinia glaberrima.* Glabrous Honewort. 2.

## TRINIA\*.

*Linnean Class and Order.* PENTANDRIA†, DIGYNIA.

*Natural Order.* UMBELLIFERÆ‡, Juss. Gen. Pl. p. 218.—Sm. Gram. of Bot. p. 132.—Lindl. Syn. p. 111.; Introd. to Nat. Syst. of Bot. p. 4.—Rich. by Macgilliv. p. 463.—Loud. Hort. a, a. A Sterile Plant; b. Umbel of a Fertile Plant.—Fig. 1. A Flower of a Sterile Plant.—Fig. 2. A Flower of a Fertile Plant.—Fig. 3. A Fruit.—Fig. 4. Transverse section of a Fruit.—Fig. 5. Leaf of a Sterile Plant.—Figs. 1, 2, 3, & 4, magnified.

\* So named in honour of Dr. TRINIAS, a celebrated Russian Botanist, who has written on Gramineæ. DON.

† See folio 48, note †.

‡ See folio 235, a.

*pumilum*, Johnson's Gerarde, p. 1054, with a figure.—*Selinum montanum*, *pumilum*, Clus. Hist. v. ii, p. 200.—Bauh. Hist. v. iii. pt. II. p. 17. f. at 18.—*Saxifraga montana minor*, foliis peucedani, Moris. v. iii. p. 274. sect. 9. t. 2. f. 15.

**LOCALITIES.**—On limestone rocks, and in mountainous pastures; but rare.—*Gloucestersh.* On St. Vincent's Rock near Bristol: RAY, and N. J. WINCH, Esq.—*Herefordsh.* In the central part of the county; DUNCUMB, in "Hist. of Herefordshire."—*Somersetsh.* At Uphill; and Whorle Hill: "Engl. Fl."—*WALES.* On Llandidno Rocks: Mr. GRIFFITHS, in B.G.—*IRELAND.* In pastures near the church of Athboy, county of Meath, in great abundance: Dr. WADE.

**Perennial.**—Flowers in May and June.

**Root** tapering, fleshy, bearded at the top with the fibrous remains of the old leaf-stalks. **Sterile plants** (see fig. *a, a.*) most humble in size, and less spreading; **fertile ones** (see fig. *b.* and fig. 5.) about a foot high. **Stem** upright, angular, striated, leafy, smooth, often purplish, very much branched, branches spreading. **Leaves** oblong, doubly pinnate; radical ones on long petioles, the rest with only short, dilated, membranous ones; **leaflets** uniform, strap-spear-shaped, or quite strap-shaped, entire; three occasionally combined at the end of the leaf. **Umbels** numerous, simple or compound, panicled, upright, without either *general* or *partial involucrums*. **Rays** angular, smooth. **Flowers** yellowish or whitish, numerous, small; the **sterile** ones (see fig. 1.) mostly without even the rudiments of a *germen*; the **fertile** ones (fig. 2.) furnished with imperfect *anthers*. **Petals** long-spear-shaped, incurved, not notched. **Filaments** (see fig. 1.) long, white. **Stigmas** capitate, almost globular. **Fruit** (figs. 3 & 4.) elliptic egg-shaped, often deprived of the *styles*, which, when permanent, are small and inconspicuous.

The whole *herb* is smooth, and of a sea-green colour. It is a native of Western and Central Europe. Its qualities somewhat resemble those of *Pimpinella saxifraga*, t. 411.

---

There lives and works

A soul in all things, and that soul is God.  
The beauties of the wilderness are his,  
That make so gay the solitary place,  
Where no eye sees them. And the fairer forms  
That cultivation glories in are His.  
He sets the bright procession on its way,  
And marshals all the order of the year;  
He marks the bounds which winter may not pass,  
And blunts his pointed fury; in its case,  
Russet and rude, folds up the tender germ,  
Uninjured, with inimitable art;  
And ere one flowery season fades and dies,  
Desigus the blooming wonders of the next.

COWPER.

\* From *en*, upon; and *petros*, a rock; in allusion to the place of growth.  
LOUDON.

† See fol. 143, note †.      ‡ See fol. 90, note †.

**LOCALITIES.**—On mountainous heaths in the North, abundantly, both in the driest and most barren rocky soils, and in logs and mossyish grounds.—*Cheshire*; Stayley and other moors, common: B. G.—*Mole-Cop*, and other hills near Congleton: N. B. G.—*Cumberland*; Cross Fell; Kirkhouse; Brampton; Skiddaw; Causey Pike; and Styhead. It is frequent on the hills, ascending to the top of Saddleback: N. B. G.—*Derbysh*. Moors beyond Mam Tor and Win Hill, from Castleton: N. B. G. Moors above Buxton; and near Chapel en le Frith: B. G.—*Durham*; On moors, frequent: B. G.—*Herefordsh*. In the northern parts of the county: B. G.—*Northumberl*and; On moors, frequent: N. B. G.—*Notts*; Sherwood Forest, near Mansfield; in a fir plantation two miles from Mansfield; Fountain Dale; Oxion Bogs; and Nottingham Meadows: N. B. G.—*Shropsh*. On Selattyn Mountain; Bog near Ellesmere; Stiperstones Hill; Castle Ringhills, near Stiperstones; and Shomere Moss, near Shrewsbury; *Fl. of Shrop*.—*Staffordsh*. On the bog at Willow Bridge: B. G. Molecop, and adjacent hilly moors; and on Chatley Moss: N. B. G.—*Sussex*; Amberley Wild Brooks; Newberry, on the Greatham side of the ditch that bounds the two parishes, but in very small quantities: N. B. G.—*Warwicksh*. Sutton Coldfield: *BREE*.—*Westmoreland*; Hay Fell: N. B. G.—*Yorksh*. Seamer Moor, and other moors near Scarbro'; Black Moor, above Kirkby Knowle; on all the moors near Settle; Cotherstone Fell; Cronkley Fell, &c. On Otley Chevin. On all the high moors in the neighbourhood of Halifax: *Fl. of Yorksh*.—Common in the mountainous parts of WALES, SCOTLAND, and IRELAND.

**Shrub.**—Flowers in April.

A small, low, trailing, shrubby plant, with numerous, leafy, partly ascending, reddish branches, clothed more or less with minute stipitate glands. *Leaves* crowded, scattered, or imperfectly whorled; linear-oblong, blunt, on short petioles; upper surface smooth, shining; under surface with scattered minute dots or glands, margins with a dense downy fringe, and so much recurved as to meet behind, the fringe forming a white, strap-shaped, streak; these characters may be best seen by making a transverse section of a leaf. *Flowers* purplish, small, axillary, solitary, almost sessile, several near together towards the summits of the branches, generally diœcious, sometimes united, or partially monœcious. *Berries* purplish-black, globose, of the size of Juniper-berries, accompanied at the base by the permanent calyx; flesh rather firm, of a pale green, except in the centre, where it is purplish; receptacle columnar, slender, with from 6 to 9 bony pale-coloured seeds fixed round it in a ring, and attached to it a little above the base (see fig. 5).

This little Heath-like plant is a native of other northern parts of Europe as well as of Britain. It is found in moors, from the Baltic to the Eastern Ocean, in Kamtschatka, and in the islands towards America. In the mountains of Lapland, and at the mines of Fahlun it will live where other plants perish with cold. The Scotch Highlanders and the Russian peasants eat the berries, which are esteemed antiscorbutic and diuretic; but they are no very desirable fruit, and if taken in large quantities, occasion head-ache. Grouse and heath-cocks feed on them; and, boiled in alum-water, they afford a dark purple dye. In Iceland and Norway a sort of wine is prepared from them; and LINNÆUS mentions, that the Laplanders use them for dying otter and sable skins black. In Oikney very strong ropes are made from the shoots of this plant. It is the badge of the clan M'LEAN.—See *Mart. Mill.*; *Burn. Outl. of Bot.*; *Loud. Arbor. et Frut. Brit.*; & *Hook. Brit. Fl.*

The *Natural Order EMPE'TREE* is composed of dwarf heath-like shrubs, with diœcious flowers composed of a perianthium of several hypogynous scales (see figs. 3 & 4.), often arranged in two rows; the stamens equal in number to the inner row. The ovary is free, on a fleshy disk; with a single style; and a stigma with as many divisions as there are cells. The fruit is fleshy, with 3, 6, or 9 bony cells, each containing a single seed, ascending, with albumen.

*Sibbaldia procumbens* Procumbent Sibbaldia 4

Ruf. coll. Del.

Publ. by W. Baxter, Botanic Garden, Oxford, 1862

Mathews. Sc.

## SIBBA'LDIA \*.

*Linnean Class and Order PENTA'NDRIA †, PENTAGY'NIA.*

*Natural Order.* ROSA'CÆÆ †, Juss. Gen. Pl. p. 334.—Sm. Gram. of Bot. p. 171.—Lindl. Syn. p. 88.; Introd. to Nat. Syst. of Bot. p. 81.—Rich. by Macgilliv. p. 528.—Loud. Hort. Brit. p. 512.; Arbor. et Frutic. Brit. v. ii. p. 670.—Don's Gen. Syst. of Gard. and Bot. v. ii. p. 523.—Mack. Fl. Hiber. p. 85.—Hook. Brit. Fl. (4th ed.) p. 404.—ROSALES; sect. ROSINÆ; subsect. ROSIANÆ; type, ROSACEÆ; subtype, FRAGRARIDÆ; Burn. Outl. of Bot. v. ii. pp. 614, 683, 699, & 700.—SENTICOSÆ, Linn.

**GEN. CHAR.** *Calyx* (fig. 1.) inferior, of 1 sepal, in 10 alternately large and small segments, permanent. *Corolla* (see fig. 2.) of 5, inversely egg-shaped petals (see fig. 3.), tapering at the base, inserted into the rim of the calyx, shorter than its smaller segments, to which they are opposite. *Filaments* 5, awl-shaped, shorter than the petals, inserted into the rim of the calyx between them. *Anthers* (fig. 4.) roundish, incumbent. *Germen*s (see figs. 5 & 7.) 5, occasionally 10, egg-shaped, compressed, very short. *Styles* lateral, from about the middle of the germen (see fig. 5.), as long as the stamens. *Stigmas* blunt. *Capsules* (seeds of Sm.) (see figs. 9 & 10.) 5, indehiscent, in the bottom of the enlarged, somewhat hardened, converging calyx, 1-seeded.

The *calyx* in 10 alternately large and small segments; the *corolla* of 5 petals, inserted on the calyx; and the 5 indehiscent, 1-seeded *capsules*; will distinguish this from other genera in the same class and order.

One species British.

**SIBBA'LDIA PROCU'MBENS.** Procumbent Sibbaldia. Scotch Cinquefoil.

**SPEC. CHAR.** Leaves trifoliate; leaflets equal, wedge-shaped, with three terminal teeth.

Fig. 1. Calyx.—Fig. 2. A separate Flower.—Fig. 3. A Petal.—Fig. 4. A Stamen.—Fig. 5. Germen, Style, & Stigma.—Fig. 6. Matured Calyx.—Fig. 7. Calyx, with the 5 capsules.—Fig. 8. Vertical Section of the same.—Figs. 9 & 10. Seeds.—Fig. 11. Transverse section of a Seed.—Fig. 12. The 2 Cotyledons.

\* So named by LINNÆUS in memory of Sir ROBERT SIBBALD, who in 1684 published a learned work, entitled "Scotia Illustrata sive Prodromus Historiæ Naturalis," etc.; the work of twenty years, in which this plant was figured and described. He was the first Medical Professor instituted at Edinburgh, about the year 1685; he greatly advanced the indigenous Botany of Scotland, and became Physician and Geographer Royal to King Charles II.—WITHERING.

† See fol. 48, note †.      ‡ See fol. 313, a.

**LOCALITIES.**—On the summits of the Highland mountains of Scotland, in a micaceous soil; common.—*Aberdeenshire*; Mountains above Loch Callater; Avon Hills: Mr. H. C. WATSON, in N. B. G.—*Banffshire*; Belrinnies: G. GORDON, in N. B. G.—*Forfarshire*; Glen Phu: W. BRANDS, in N. B. G.—On the mountains above the old Sonchus Station: Mr. H. C. WATSON, in N. B. G.—*Inverness-shire*; Badenoch side of Cairngorm: G. GORDON, in N. B. G.—*Pertshire*; Near the summit of Ben More; Killin Mountains; and Ben Lawers: Mr. H. C. WATSON, in N. B. G.—*Ross-shire*; Ben Wevis; G. GORDON, in N. B. G.—*Sterlingshire*; North side of Ben Lomond, three-fourths of the way up the mountain, plentiful: Mr. BROWN.—*Sutherland*; Ben More: W. H. CAMPBELL, in N. B. G.—Ben Layal: Mr. H. C. WATSON, in N. B. G.

### Perennial.—Flowers in July.

*Root* woody, tufted, branched, blackish on the outside. *Stems* herbaceous, trailing, leafy, from 1 to 3 inches long, round, not much branched, hairy. *Leaves* alternate, compound, of 3 wedge-shaped, bright green, veiny leaflets, each leaflet entire at the edges, and 3-toothed at the summit, the middle tooth the smallest; the lateral ones sometimes cloven. *Petioles (leaf-stalks)* longer than the leaflets, each with a pair of attached, pointed, parallel, membranous *stipulas* at its base. *Flowers* small, in corymbose, leafy tufts. *Calyx* hairy, permanent. *Corolla* yellow, smaller than the calyx; petals inversely egg-shaped, entire. *Stamens* very short. *Styles* 5, sometimes 10, affixed laterally to the middle of the Germen (see fig. 5).

Whole plant somewhat hairy. Sir J. E. SMITH is of opinion, that PLUKENET's figure (t. 212. f. 3.), which LINNÆUS and WILLDENOW refer to this, belongs rather to *Potentilla subacaulis*, a much more soft and downy plant, with solitary flowers, of a larger size. (See *Sm. Engl. Fl.*)

*Sibaldia procumbens* is a native, in moist places, in the mountains of Lapland, Switzerland, Siberia, and North America. With us it has only been found in Scotland. It is one of the rare plants, amongst many others, which LINNÆUS was so delighted on finding at the commencement of his journey over the Lapland Alps. "In the afternoon," [of July 6, 1732, old style,] says this illustrious Naturalist, "I took leave of Hytton, and, at the distance of a mile from thence, arrived at the mountain of *Wallavari* (or *Hwallawari*), a quarter of a mile in height. When I reached this mountain, I seemed entering on a new world; and when I had ascended it, I scarcely knew whether I was in Asia or Africa, the soil, situation, and every one of the plants being equally strange to me. Indeed I was now, for the first time, upon the Alps! Snowy mountains encompassed me on every side. I walked in snow, as if it had been the severest winter. All the rare plants that I had previously met with, and which had from time to time afforded me so much pleasure, were here as in miniature, and new ones in such profusion, that I was overcome with astonishment, thinking I had now found more than I should know what to do with."—*Tour in Lapland*, v. i. p. 283.

*Illecebrum verticillatum* Whorled knot-grass.

Malvern Dist. & Sc.

Pub'd by W. Baxter Botanic Garden Oxford 1867

## ILLE'CEBRUM \*.

*Linnean Class and Order. PENTA'NDRIA†, MONOGY'NIA.*

*Natural Order. ILLECE'BREA‡, Dr. R. Brown.*—Lindl. Syn. p. 60; Introd. to Nat. Syst. of Bot. p. 164.—*PARONYCHIEÆ*, Rich. by Macgilliv. p. 508.—Loud. Hort. Brit. p. 516.—Don's Gen. Syst. of Gard. and Bot. v. viii. p. 84.—Hook. Brit. Fl. (4th ed.) p. 407.—*AMARANTHI*, Juss. Gen. Pl. p. 87.—Sm. Gram. of Bot. p. 92.—*QUERNEALES*; sect. *RUMICINÆ*; type, *SCLERANTHACEÆ*; Burn. Outl. of Bot. pp. 523, 587, & 594.—*HOLERACEÆ*, Linn.

**GEN. CHAR.** *Calyx* (see fig. 1, *a*. and fig. 2.) inferior, 5-angled, of 5 coloured, cartilaginous, hooded, permanent sepals, their back elongated into a horn-like process. *Corolla* none, or reduced to 5 awl-shaped scales, which alternate with the sepals (see fig. 1, *b*). *Filaments* (see fig. 1.) hair-like, from 2 to 5, opposite the sepals, and inserted into their base. *Anthers* simple, of 2 cells. *Germen* superior, egg-shaped, pointed. *Style* very short. *Stigmas* 2, capitate. *Capsule* (fig. 3.) roundish, pointed at each end, included in the calyx, of 1 cell, with 5 valves, or separable along 5 streaks. *Seed* (fig. 4.) solitary, egg-shaped, pointed at each end, inserted into one side of the capsule. *Embryo* nearly straight, placed on one side of the albumen, which is farinaceous.—Small *herbs*, with opposite *leaves*, furnished with scarious *stipulas* at their base (see fig. 5, *a*). *Flowers* (fig. 5, *b*.) axillary, or in cymes; with scarious *bracteas*, smaller than the flowers.

The *calyx* of 5 cartilaginous, hooded sepals, their back elongated into a horn-like process; the *corolla* wanting, or reduced to 5 awl-shaped scales; and the superior, 1-celled, 1-seeded capsule, covered by the calyx; will distinguish this from other genera in the same class and order.

One species British.

**ILLE'CEBRUM VERTICILLA'TUM.** Whorled Knot-grass. Whorled Creeping Milkwort.

**SPEC. CHAR.** Stems procumbent, thread-shaped, smooth. Leaves broadly egg-shaped. Flowers crowded in the axils of the leaves, whorled.

**Perennial.**—Flowers in July.

*Root* creeping. *Stems* trailing, thread-shaped, smooth, from 2 to 6 inches long, often producing slender thread-shaped fibres from the same joints with the leaves and flowers. *Leaves* opposite, small, egg-shaped, or roundish, entire, rather fleshy, smooth, almost sessile, upper ones crowded. *Stipulas* (see fig. 5, a.) intrafoliaceous (placed above the leaf), small, white, scarious, jagged at the margin. *Flowers* (see fig. 5, b.) small, snow white, sometimes reddish, crowded together in whorls in the axils of the leaves, and furnished with small white scarious bracteas at their base. *Sepals* (see fig. 1, a. and fig. 2.) cartilaginous, blunt, hooded, with long, twisted, terminal bristles or horn-like processes. *Petals* (see fig. 1, b.) (scales of SM.) awl-shaped, reddish, pointed, alternate with the sepals. *Filaments* very short. *Stigma* notched. *Capsule* of 5 distinct valves.

A delicate and beautiful little plant, a native of Flanders, Germany, England, and many other parts of Europe; but it has not been found either in Scotland or Ireland.

---

“ GOD of the changeful year!—amidst the glow  
    Of strength and beauty, and transcendent grace,  
Which, on the mountain heights, or deep below,  
    In shelter'd vales, and each sequester'd place,  
Thy forms of vegetable life assume,  
    —Whether Thy pines, with giant arms display'd,  
Brave the cold north, or wrapt in eastern gloom,  
    Thy trackless forests sweep, a world of shade;  
Or whether, scenting ocean's heaving breast,  
    Thy odiferous isles innumerable rise;  
Or, under various lighter forms impressed,  
    Of fruits, and flowers, Thy works delight our eyes;—  
God of all life! whate'er those forms may be;  
    O! may they all unite in praising THEE!”

W. ROSCOE.

**Perennial.**—**Flowers in July.**

*Root* spindle-shaped, acrid but aromatic. *Stem* upright, nearly simple, about a foot high, round, smooth, striated, somewhat leafy. *Leaves* compound, those from the root and lower part of the stem twice ternate, on longish petioles; upper stem-leaves often simply ternate, and nearly sessile; *leaflets* large, rhomboid, broad, acute, rather fleshy, veiny, smooth, deeply and irregularly serrated, entire towards the base. *Petioles* bordered, with a purplish compressed membrane, at the base. *Umbels* upright, terminal, smooth, many-rayed, not very large. *Universal involucrum* of about 6, oblong, unequal, entire leaves; *partial umbel* of more numerous, spear-shaped, ones. *Flowers* small, equal, white, with a reddish tinge. *Calyx* 5-toothed. *Petals* inflexed. *Anthers* red. *Fruit* (fig. 2.) oblong, ribbed; the ribs with somewhat membranous wings.

As well as of Britain, this plant is a native also of Lapland, Sweden, Denmark, North America, and Siberia; Kotzebue's Sound, and Kamtschatka. The herb is eaten either raw as a salad, or boiled as greens, by the natives of Scotland and its isles. The flavour is highly acrid, and though aromatic, and perhaps not unwholesome, very nauseous to those who are unaccustomed to such food. In the Isle of Skye it is called *Shunis*. The root is reckoned a carminitive, and an infusion of the leaves, in whey, good physic for calves.

Horses, sheep, and goats, are said to eat this plant; cows to refuse it.

*Saussurea alpina. Alpine Saussurea.* 21

## SAUSSUREA \*.

Linn. Class & Order. SYNGENE'SIA †, POLYGA'MIA, E'QUALIS ‡

Natural Order. COMPO'SITÆ §, tribe, CYNAROCEPHALÆ, Juss.

—Lindl. Syn. pp. 140 & 152.; Introd. to Nat. Syst. of Bot. pp. 197 and 200.—Mack. Fl. Hibern. pp. 142 & 154.—Hook. Brit. Fl. (4th edit.) p. 410.—COMPO'SITÆ; subord. CARDUA'CÆ: Loud. Hort. Brit. pp. 520 & 521.—SYNANTHE'REÆ; tribe, CYNAROCEPHALÆ; Rich. by Macgilliv. pp. 454 & 455.—CINAROCEPHALÆ, sect. I. Juss. Gen. Pl. pp. 171 & 172.—Sm. Gram. of Bot. p. 121.; Engl. Fl. v. iii. p. 334.—SYRINGALES; type, CYNARACEÆ; Burn. Outl. of Bot pp. 900 & 931.—COMPO'SITÆ, Linn.

GEN. CHAR. *Involucrum* (*common calyx*) (fig. 1.) oblong, nearly cylindrical, of numerous imbricated, unarmed, permanent scales. *Corolla* compound, uniform; *florets* (see fig. 2.) rather numerous, perfect, equal, tubular, funnel-shaped; the limb in 5 deep equal segments. *Filaments* 5, hair-like, very short. *Anthers* united in a cylindrical tube, the length of the florets, setose below. *Germen* (see fig. 2.) inversely egg-shaped. *Style* (see fig. 2.) thread-shaped, scarcely prominent. *Stigma* oblong, reflexed. *Seed* inversely egg-shaped, somewhat angular. *Pappus* (see fig. 2.) double, sessile; *outer* of short rough bristles; *inner* (see figs. 2 & 3.) long and feathery. *Receptacle* bristly or chaffy.

The oblong *involucrum* of numerous, imbricated, unarmed scales; the sessile *pappus* in two rows; the *outer* of short rough bristles, the *inner* long and feathery; and the scaly *receptacle*; will distinguish this from other genera, with the florets all tubular, in the same class and order.

This differs from *Serratula* (t. 174.) in the *pappus* being double, in two unequal rows.

One species British.

SAUSSUREA ALPINA. Alpine Saussurea. Alpine Sow-wort. Dock-leaved Thistle-gentle.

SPEC. CHAR. Leaves spear-shaped, toothed, cottony beneath; those of the root egg-spear-shaped, stalked. Flowers in a clustered umbel.

**LOCALITIES.**—On moist alpine rocks, very rare.—*Cumberland*; Castle; and near the Church at Bewcastle: *HUTCHINSON*, in N. B. G.—On Helvellyn: N. B. G.—*Lancashire*; In Brearcliff near Burnley: *MERRETT*.—**WALES.** *Caernarvonshire*; On the highest rocks of Snowdonia, as Clogwyn y Garnedd; Iscolon dûon, &c.: *RAY*. Rocks of Crib y Ddescil and Cwm idwel, in places scarcely accessible: Mr. *GRIFFITH*.—**SCOTLAND.** *Argyleshire*; Glenorchy; Ben Arthur, by Arrochar: W. *BORRER*, Esq. in *Fl. Scot.*.—*Dumfrieshire*; Near Moffat; and in a deep gully at the foot of White Coom Edge, Annandale: Dr. *WALKER*.—*Forsfarshire*; Rocks on the left side of Glen Doie, and other parts of the Clova Mountains: Mr. H. C. *WATSON*, in N. B. G.—*Inverness-shire*; In Skye; and on mountains in the Isle of Rum: *Fl. Scot.*.—*Perthshire*; Ben Ledi; near the summit of Ben Lawers; Craig Calliach; and Schroeine ach Lochen: N. B. G. In Glen Lyon: *LIGHTFOOT*.—*Ross-shire*; Observed in this county by the Rev. G. *GORDON*.—*Sterlingshire*; On Ben Lomond: N. J. *WINCH*, Esq.—*Sutherland*; Ben Hope; and hills near Inch-nadamff: N. B. G.—**IRELAND.** *County of Kerry*; Cliffs near the summit of Brandon Mountain: 1804; Mr. *MACKAY*.

**Perennial.**—Flowers in July and August.

*Root* somewhat woody, tough; blackish on the outside. *Stems* simple, from 3 inches to a foot high, upright, round, leafy, striated, cottony. *Leaves* very various in length and breadth, usually egg-shaped, inclining to heart-shaped; sometimes strap-spear-shaped, always more or less toothed; nearly smooth, and of a fine green on the upper side; white and cottony on the under; the lower leaves on longish, channelled *petioles*, upper ones almost sessile. *Flowers* few, in a terminal, corymbose, or umbellate, tuft, very handsome. *Involucrum* (fig. 1.) somewhat downy, its scales tipped with purple or brown. *Florets* (fig. 2.) pink, with blue *anthers*. *Pappus* (see figs. 2 & 3.) as long as the *florets*, elegantly feathered.

This plant is a native of the high mountains of Lapland, Norway, Austria, Switzerland, Silesia, and Siberia. *JOHNSON*, the editor of *GERARDE'S Herbal*, appears to have been the first who discovered it in Britain; he is said to have found it on Snowdon, and some other high mountains in Wales, previous to 1641.

It is subject to much variation, especially in the form of the leaves, occasioned, probably, by local accidents.

---

Oh!—they're fair!

Most wonderful and lovely are they all,—  
From our own daisy “ crimson-tipped,” that greets  
Our English childhood with its lowly look,  
To the proud giants of the western world,  
And gorgeous denizens of either Ind,  
Towering in Nature's majesty and might,  
And lifting their radiant heads to hail  
The sun—their monarch—as he burns above.  
Who does not love them?

From the *Parterre*.

**LOCALITIES.**—On bushy heaths, and in woods, especially on a gravelly soil; not common.—*Oxfordshire*; Between Caveisham and Maple Durham.—*Berks*; Streatley Wood; H. WOOLLCOMBE, Esq. Bradfield: Rev. Mr. WITTS.—*Cambridgeshire*; Anglesey Abbey.—*Cornwall*; Lemorna Cove; and St. Martin's Isle, Scilly.—*Devon*; Harford Wood, three miles from Sidmouth. Cliffs at Marychurch, and Cockington Wood.—*Durham*; Near Cockerton; and in Cliff Wood.—*Hants*; Shore near Portsmouth. Not uncommon about Southampton. New Forest, near Stony Cross. Stoke, near Gosport (variety *laxus*).—*Kent*; Tunbridge Wells. N. and M. Kent.—*Norfolk*; Hethel Woods near Norwich.—*Suffolk*; Heath near Lowestoft.—*Surrey*; Claygate Common; Coulsdon; in Norwood; and on Cockshot Hill, S. E. of the Mill.—*Sussex*; About Hastings. Local in W. Sussex.—*Yorksh.* Near Ripon.—**SCOTLAND.** *Ayrshire*; Skeldon Woods, near Ayr.—*Lanarkshire*; In the woods at Bothwell, near Glasgow.—It has not been found in **IRELAND**.

**Perennial.**—Flowers in March and April.

*Root* thick, fleshy, brown on the outside, white within; much divided at the crown, and furnished with long fibres which strike deep into the ground. *Stems* upright, from 1 to 3 feet high, tough, woody, rigid, much branched, round, green, striated; not flowering till the second year, after which they die down to the root. *Leaves* a continuation of the branches, equally firm and durable, with scarcely any *petioles* (*leafstalks*), alternate, spreading every way, obliquely twisted, egg-shaped, not an inch long, many-ribbed, each tipped with a sharp point. *Flowers* small, solitary, near the middle of the upper side of each leaf, apparently sessile, but their stalk is imbedded beneath the outer coat, and runs down to the base of the leaf, from whence it may with ease be dissected. *Calyx* and *Corolla* of a yellowish-green. *Nectary* (fig. 4.) purplish. *Berry* (fig. 5.) nearly as large as a wild Cherry, scarlet, juicy, and sweetish. *Seeds* (fig. 7.) originally 6, but only 1 or 2 come to perfection; these are hard, white, and semi-transparent. Instead of a leaflet, of considerable size, which accompanies the flower in some species, there is in this a small spine, or bristle, winged at the base, besides 2 or 3 membranous bracteas, on the elongated fruit-stalk. *Ruscus laxus* of Tr. of Linn. Soc. v. iii. p. 334, is a variety of this with more extended and wavy *branches*, and the *leaves* rather elliptical than egg-shaped, and tapering at the base. *Sm. Engl. Fl.*

*Ruscus aculeatus* is an evergreen, somewhat shrubby, plant, smooth in every part. It is a native of Europe, but not of the more northern parts. It is also found in Asia and Africa. The green shoots are cut, bound into bundles, and sold to the butchers for sweeping their blocks. Huxters place the boughs round their bacon and cheese to defend them from mice, the prickly leaves being impenetrable. It is also used, in London, by the manufacturers of cigars, &c., for sprinkling the saline liquor over the tobacco leaves. The tender young shoots, in Spring, are sometimes gathered and eaten by the poor like those of Asparagus; and the branches, with the ripe fruit on them, were formerly stuck up in sand, with the stalks of the common paeony (*Paeonia corallina*, t. 217,) and the wild Iris (*Iris foetidissima*), full of their ripe seeds, which, altogether, made a show in rooms during Winter. The root has a bitterish taste, and was formerly much used in medicine as an aperient and diuretic, particularly in cases of dropsy.—See *Loud. Arb. et Frutic. Brit.*

---

The *Natural Order SMILA'CEÆ* is composed of monocotyledonous *herbaceous plants* or *under-shrubs*. Their *leaves* have parallel veins. Their *flowers* are either perfect or dioecious, inferior, pataloid, 6-parted, and regular; with 3, 6, or 8 stamens, inserted into the segments near their base, seldom hypogynous. Their *ovary* is free, 3- or 4-celled; and the *cells* 1-, 2-, or many-seeded. The *style* is single, with a simple, or 3-lobed *stigma*. The *fruit* is a roundish *berry*; and the *seeds* have a membranous *testa*, and horny *albumen*.—The British genera are, *Ruscus*, t. 474.—*Convallaria*, t. 78.—and *Paris*, t. 6.

\* From *physa*, Gr. a bladder; and *sperma*, Gr. a seed.

† See fol. 48, note †.      ‡ See fol. 235, a.

**LOCALITIES.**—In bushy fields; extremely rare.—*Cornwall*; First found by Mr. STEVENS, in the time of DILLENIUS; after which it remained for half a century unobserved. In great plenty in a field more than a mile north of Bodmin, which had then (1788) been ploughed, after having lain fallow for ages: Mr. PENNINGTON. In wheat-field, and in an adjoining coppice called Margaret, or Margaret, Wood, about three furlongs from the Bodmin Turnpike, that leads to Launceston; (1789): Sir T. CULLUM. In a field about half a mile further from Bodmin, [than Mr. PENNINGTON's station for it,] on ground sloping into a valley facing to the west, and nearly at the bottom of the slope: June, 1793; Dr. WITHERING. "Shown to Mr. SOWERBY and me in fields about half a mile north of Bodmin by Dr. HALL, plentifully:" D. TURNER, Esq. (1799?) in B. G. Plentifully at Hungerill, in the parish of Cardynham, near Bodmin, on the sloping side of a barren hill: Mr. STACKHOUSE. In a wood, and corn-field at Cardynham Parsonage; and in Draw-wood, Bradoc: Mr. FORSTER, jun. Very abundant two miles north-west of Bodmin, on Hare Down, half a mile above Dunmere River: Rev. J. P. JONES, in *Bot. Tour.* p. 37. Abundant in Oak Coppices, and adjacent fields and hedges, near Bodmin: Mr. H. C. WATSON, in N. B. G.

### Perennial.—Flowers in July.

*Root* spindle-shaped, descending deep into the ground. *Stem* from 18 inches to 2 feet high, solitary, upright, round, striated, smooth; paniced above, purplish at the base. *Leaves* mostly radical, on long *petioles*, thrice ternate; *leaflets* wedge-shaped, cut and laciniated, or deeply 3-parted, the segments pointed, smooth, or minutely downy on the veins and margins. *Stem-leaves* few, of 3 strap-spear-shaped, pointed, entire leaflets; the uppermost of all often simple. *Umbels* terminal, upright, of several *universal* as well as *partial*, smooth, angular *rays*. *Universal involucrum* of from 4 to 8, spear-shaped, or somewhat egg-shaped, pointed leaves, much shorter than the rays; *partial ones* similar, equal to the partial rays. *Calyx* evident. *Petals* white, very slightly irregular in the outermost flowers only, inversely egg-shaped, or inversely heart-shaped, with an incurved point. *Anthers* yellow. *Germen* egg-oblong, laterally compressed, furrowed. *Styles* tumid, and almost globular at the base; at first upright, afterwards spreading, and finally horizontal, permanent. *Stigmas* bluish. *Fruit* almost globose, laterally compressed, and contracted between the *carpels*, so that the fruit is double. *Carpels* roundish, with 5 ribs and 4 broad, brown *vitta*; the coat crustaceous, and so loose that the *seed* is quite free within; a transverse section of this seed is crescent-shaped.—The root discharges a yellow resinous juice when wounded. See Sir J. W. HOOKER's *Brit. Fl.*

This rare and very local plant has never been found in any other part of Britain than about Bodmin, though it is said to be not unfrequent in the south of Europe, and in Greece. Dr. WITHERING says, that cattle are so fond of the plant that they eat it down to the ground wherever they can get at it; so that it is usually found only in places where it is so protected by thorns and briars as to be inaccessible to them.

The drawing for the accompanying plate was made from a specimen gathered near Bodmin by DAWSON TURNER, Esq. in 1799, and deposited in the SHERARDIAN Herbarium at the Oxford Garden.

## ROTTBO'LLIA \*.

*Linnean Class and Order.* TRIA'NDRIA †, DIGY'NIA.

*Natural Order.* GRAMI'NEÆ, Juss. Gen. Pl. p. 28.—Sm. Gram. of Bot. p. 86.; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293.; Introd. to Nat. Syst. of Bot. p. 292.—Rich. by Macgilliv. p. 393.—Loud. Hort. Brit. p. 542.—Mack. Fl. Hibern. p. 294.—Hook. Brit. Fl. (4th ed.) p. 426.—GRAMINA, Linn.—GRAMINA'LES; sect. TRITICINÆ; type, HORDEA'CEÆ; Burn. Outl. of Bot. v. i. pp. 359, and 362.

**GEN. CHAR.** Common Receptacle (*rachis*), or main stalk, many-flowered, elongated, jointed, finally separable, with a channel in each joint (see fig. 3.), alternately disposed, to receive the spikelets (see fig. 1.), which are mostly 1-flowered, seldom 2-flowered. Calyx of 2 glumes, unilateral, and sometimes combined into one, longer than the corolla. Corolla of 2 spear-shaped, pointed, membranous, nearly equal, paleæ, inflexed at the edges. Nectary of 2 acute scales. Filaments (see fig. 1.) 3, hair-like. Anthers pendulous, cloven at each end. Germen (see fig. 2.) oblong, bluntish. Styles 2, short. Stigmas (see fig. 2.) widely spreading, feathery. Seed elliptic-oblong, shut up in the cavity of each joint of the rachis, by the closed glumes, and falling off with it.

The 1- or 2-flowered spikelets, imbedded in the rachis; and the calyx of 2 parallel, sometimes combined, awnless glumes; will distinguish this from other genera, with the inflorescence in 2-sided spikes, in the same class and order.

One species British.

ROTTBO'LLIA INCURVA'TA. Bent Rottbollia. Sea Hard-grass. Snake-tail.

**SPEC. CHAR.** Spikes cylindrical, awl-shaped. Glumes combined below. Floret solitary. Corolla awnless.

Agr. p. 42. t. 2. f. 1. A. B.

Fig. 1. A Spikelet; *a*, (on the left-hand side,) the two, combined, Glumes; *b*, and *a*, (on the right-hand side,) the two Paleæ.—Fig. 2. Germen, Styles, and Stigmas.—Fig. 3. A joint of the Rachis, showing the cavity in which the spikelet is embedded before and after it has flowered.

\* So named by the younger LINNÆUS, in memory of CHRISTIAN FRIES ROTTBOELL, a Professor of Botany at Copenhagen.      † See fol. 36, note †.

**LOCALITIES.**—On the sea-coast, in salt marshes, in various places.—**CAMBRIDGESHIRE**; Wisbeach, by the river-side, near a public house called the Anchor: Rev. R. RELHAN.—**CORNWALL**; In the Vale of Menachan: N. B. G.—**DEVON**; Exmouth; Parsonage Style, Lympstone: *Fl. Devon*.—**DORSETSHIRE**; In the waste ground at the back of the Promenade, near Weymouth. On the Chesil Beach between the Ferry and Portland; and on the Cliff between Weymouth and Lansford Castle: Rev. A. BLOXAM.—**DURHAM**; In Seaton Pasture: Mr. BACKHOUSE. In the salt marshes of Tyne, Wear, and Tees: N. J. WINCH, Esq.—**ESSEX**; Walton Marshes: *Mag. Nat. Hist.*—**GLOUCESTERSHIRE**; Salt Marsh, below King's Weston, near Bristol: Dr. STOKES. River-side: N. B. G. Frequent by the side of the Avon under Cook's Folly; also at Sea Mills: T. B. FLOWREN, Esq.—**KENT**; Upon the shore, and in dry salt marshes at Dimchurch; upon the shore, Folkstone West: Rev. G. E. SMITH. Thames, by Gravesend; Marshes about Northfleet; and in the Marshes by the Medway, between Cuxton and Rochester: Mr. A. IRVING.—**LANCASHIRE**; North Shore, by Bank Hall, near Liverpool: Dr. BOSTOCK.—**LINCOLNSHIRE**; Near Friestone: 1826; Dr. HOWITT, in N. B. G.—**NORFOLK**; Yarmouth Denes: J. PAGET. Breydon Bank; and in sandy ground by the river; not uncommon: *Hist. Yar.* At Sheringham: Rev. Dr. GOODENOUGH.—**NORTHUMBERLAND**; In the salt marshes of Tyne: N. J. WINCH, Esq.—**SOMERSETSHIRE**; At Burnham; Berrow; and Steart: N. B. G.—**SUFFOLK**; At the head of Lowestoft Broad: Mr. WOODWARD.—**SUSSEX**; On the Sands just above high-water mark near Shoreham: J. D. SALMON, in *Phyt.*—**YORKSHIRE**; Upon banks in the salt marshes at Coatham Boghall, near Whitby: Mr. H. BAINES. Humber Bank, near Hull: Aug. 1841; J. H. THOMPSON, Esq., Magdalen Hall.—**WALES**. *Anglesea*; Between Friars and Penmon, just above the beach; Cemlyn and Dulais Bays: Rev. H. DAVIES.—*Denbighshire*; Near the coast, E. and W. of Rhuddlan: N. B. G.—*FLINTSHIRE*; Near the coast both E. and W. of Rhuddlan: N. B. G.—**SCOTLAND**. *Edinburghshire*; Musselburg Links: N. B. G.—*Fifeshire*; Ballast-heaps, St. David's, probably introduced: N. B. G.—*Haddingtonshire*; Salt marshes near Aberlady Bay: G. DON.—*Kirkcudbright*; Arbigland in Galloway: Rev. J. LIGHTFOOT.—*Linlithgowshire*; Shore of the Forth, some miles westward of Queensferry: Mr. GENTLE, in N. B. G.—**IRELAND**. Near Irishtown; Portmarnock; banks of the river Lee, below Cork; South Isles of Arran, and other places, abundant: Mr. MACKAY.

**Annual.**—Flowers in July and August.

**Root** fibrous. **Culms** branched, numerous, procumbent at the base, from 2 to 8 inches high, round, smooth, jointed, leafy. **Leaves** spreading, strap-shaped, short, pointed, single-ribbed, striated, rough on the upper surface, and at the edges. **Sheaths** slightly tumid, striated, smooth. **Stipula** (*ligula*) short and blunt. **Spikes** terminal, solitary, from 1 to nearly 3 inches long, more or less incurved, cylindrical, smooth. **Spikelets** (fig. 1.) so closely adpressed into the alternate hollows of the rachis, except when in flower, as to make the spike appear like a continuation of the culm. **Glumes** (see fig. 1. left-hand *a.*) more or less combined, strap-spear-shaped, striated, green, their margins white and membranous. **Paleæ** (see fig. 1. *b.* and right-hand *a.*) whitish, membranous, incurved at the edges, nearly as long as the glumes, and, like them, awnless.

It is sometimes drawn up weak by growing among other grasses, the culms are then more slender and upright, and the spikes nearly straight. In this state it is the *Rottbollia filiformis* of Mr. G. DON, and some other authors. It is found at Aberlady, in Scotland; and near Dublin, in Ireland; and it is thought it may probably be the more common variety in the south and east of England, as at Gravesend, &c.

For the specimen figured I am indebted to the kindness of J. H. THOMPSON, Esq. of Magdalen Hall, Oxford.

*Cynoglossum officinale. Common Hounds-tongue. 3*

Matthew Delattre.

Pub'd by W. Baile Botan. Garden, Oxford, 1819.

## CYNOGLO'SSUM \*.

*Linnean Class and Order.* PENTA'NDRIA†, MONOGY'NIA.

*Natural Order.* BORAGI'NEÆ‡, Juss. Gen. Pl. p. 128.—Sm. Gram. of Bot. p. 102.—Lindl. Syn. p. 163.; Introd. to Nat. Syst. of Bot. p. 241.—Rich. by Macgilliv. p. 440.—Loud. Hort. Brit. p. 527.—Don's Gen. Syst. of Gard. and Bot. v. iv. p. 306.—Mack. Fl. Hibern. p. 167.—Hook. Brit. Fl. (4th ed.) p. 413.—ASPERIFOLIAE, Linn.—Sm. Engl. Fl. v. i. p. 247.—SYRINGALES; subord. PRIMULOSÆ; sect. SOLANINÆ; type, BORAGINACEÆ; Burn. Outl. of Bot. v. ii. pp. 900, 958, 982 & 1005.

**GEN. CHAR.** *Calyx* (see figs. 1 & 6.) inferior, of 1 sepal, in 5 deep, oblong, slightly pointed segments, permanent. *Corolla* (fig. 2 & 4.) of 1 petal, funnel-shaped, scarcely longer than the calyx; tube cylindrical, shorter than the limb, which is divided half-way down into 5 rounded segments (see fig. 4.); mouth about half closed with as many convex, horizontal valves. *Filaments* (see fig. 4.) 5, in the throat of the corolla, lower than the valves, and alternate with them. *Anthers* roundish. *Germens* (see fig. 5.) 4, depressed, horizontal. *Style* (see fig. 5.) central, awl-shaped, almost as long as the tube of the corolla, permanent (see fig. 6). *Stigma* small, notched. *Nuts* (*seeds*, Sm.) (see figs. 3, 7, & 8.) 4, 1-celled, depressed, roundish, imperforate at the base, more or less rough with hooked prickles, sometimes bordered, all attached horizontally to a central columnar *receptacle*, formed of the hardened permanent, angular style (see fig. 6).

The 5-cleft *calyx*; the monopetalous, inferior, short, funnel-shaped *corolla*, its mouth half closed with rounded valves; and the 4 depressed, imperforate *nuts*, fixed to the *style*, or central column; will distinguish this from other genera in the same class and order.

Two species British.

CYNOGLO'SSUM OFFICINA'LE. Common Hound's-tongue. Great Hound's-tongue. Dog's-tongue.

**SPEC. CHAR.** Stem upright. Stem-leaves broadly spear-shaped, sessile, downy. Flowers without bracteas. Stamens shorter than the corolla.

**LOCALITIES.**—In waste ground, and by road-sides; more or less common in most counties in ENGLAND; more rare in SCOTLAND.

**Biennial.**—Flowers in May and June.

**Root** fleshy, tapering, as thick as the finger or thumb, and from 6 inches to a foot or more long, blackish on the outside, whitish within. **Stem** 2 or 3 feet high, upright, branched, very leafy, furrowed, downy. **Root-leaves** 8 or 10 inches long, and 4 or 5 broad, nearly elliptical, on long petioles; **stem-leaves** much smaller, lower ones strap-spear-shaped, tapering at the base; upper ones sessile, wavy, spear-shaped, broadest at the base, all entire, with a strong mid-rib, and several lateral veins, and clothed on both sides with a silky down, which gives them a greyish colour. **Clusters** of flowers (*racemes*) terminating the stem and branches, hoary and downy. **Flowers** small, on short, downy, partial stalks, which are a little elongated after flowering, and all turned to one side. **Bracteas** none. **Segments of the Calyx** oblong, connivent. **Corolla** of a dull crimson, its valves purplish. **Nuts** (*carpels*, DON, *seeds*, LINN.) (see figs. 7 to 10.) egg-shaped, depressed, densely clothed with curiously barbed prickles, which are broad at the base, and taper upwards (see fig. 13). **Seeds** (see fig. 11.) single, smooth, somewhat egg-shaped, pointed.

The whole *herb* is downy, and very soft to the touch, of a dull green colour, with a disagreeable smell, like most of the species, much resembling that of mice. It is a native of Asia, Africa, and North America, as well as of Europe, in waste places, and by way-sides and margins of fields, and particularly near towns. It is reported to be deleterious, and the dingy lurid appearance of its leaves, peculiar to poisonous herbs of the narcotic kind, seems to favour the opinion; nor are facts wanting to confirm it. MORISON, in his *Historia Plant. Oxon.* v. iii. p. 450, relates that a whole family at Oxford, who, by mistake, eat the boiled leaves of this plant for those of Comfrey (*Symphytum officinale*, t. 101.), were soon afterwards all seized with vomiting, stupor, sleepiness, &c., which symptoms continued alternately for almost forty hours, and with such severity, that one person died. RAY, however, says that Dr. HULSE frequently used a decoction of the roots for internal use, and at the same time applied them outwardly as a poultice to scrophulous tumours with safety and advantage; hence it appears that this part of the plant at least cannot be considered as an active poison. It is now discarded from common practice. LIGHTFOOT says, that no quadruped except the goat will eat this plant; and we are told by M. BORFUX, that if it is gathered when in full vigour, bruised with a hammer, and laid in any place frequented by rats and mice, they will immediately forsake the premises. The Caterpillar of the Scarlet Tyger Moth (*Phalæna Dominula*, LINN.; *Callimorpha Dominula*, LEACH), feeds on this plant.

It is sometimes found with a white flower.

*Echinosiphon Spinosa* Prickly Sea-Parsnep.

Ger. p. 533, fig. 2.—Ray's Syn. (2nd ed.) p. 114.—*Pastinaca marina*, Bauh. Hist. v. iii. pt. II. p. 196, with a figure.—Park. Theatr. Bot. p. 1286. f. 3.

**LOCALITIES.**—On sandy sea-shores.—*Dorsetshire*; Near Weymouth; on the Chesil Beach between the Ferry and Portland; and on the cliff between Weymouth and Lansford Castle: Aug. 1837; Rev. A. BLOXAM.—*Kent*; “Between Feversham and Sea-Salter: BLACKSTONE. Near Sandwich: GERARDE. In both these places I have sought for it in vain:” L. W. DILLWYN, in *Botanist's Guide*. GERARDE also says it grows between Whitstable and the Isle of Thanet.—*Lancashire*; At Roosebeck Low Furness: RAY. Mr. WOODWARD could not find it there.

**Perennial.**—Flowers in July.

*Root* spindle-shaped, long and fleshy. *Stem* upright, from 6 inches to a foot high, glaucous, furrowed, finely downy, and very much branched, branches spreading in every direction. *Leaves* rigid, alternate or opposite, doubly pinnatifid, their segments narrow, channelled, entire, stiff, and spinous-pointed. *Umbels* terminal, large, of several *partial umbels*. *Universal Involucrum* (see fig. 1.) of many undivided leaves, about as long as the stalks of the *universal umbel*; *partial involucra* of several, much smaller leaves, which finally become confluent with the receptacle and with each other. *Flowers* white, or pale flesh-coloured, numerous; those in the margin radiant, and sometimes neuter (see fig. 3.) *Fruit* (see fig. 8.) egg-shaped, encompassed with the spreading hardened, *partial involucrum*, and crowned with the thickened stalks and permanent calyx of the faded sterile flowers.—There are rudiments of 2 *seeds*, though only one comes to perfection. See Smith's *Engl. Fl.*

The roots are reported to be eatable, having the flavour of Parsnip, with a stimulating and diuretic quality; and it is also said that the young leaves afford a very wholesome and excellent pickle. It is a native of the sea-coast of Europe, especially in the Mediterranean Sea. From its not having, for many years, been found in the localities recorded for it by GERARDE, RAY, and BLACKSTONE, it was thought to be extinct in Britain, until the Rev. ANDREW BLOXAM, M. A. of Rugby, in Warwickshire, discovered it on the coast of Dorset, in 1837, as stated above.

The drawing for the annexed plate was made from a specimen preserved in the SHERARDIAN Herbarium in the Oxford Garden.

## A'CINOS \*.

*Linnean Class and Order.* DIDYNA'MIA †, GYMNOSE'RMIA ‡.

*Natural Order.* LABIA'TÆ §, Juss. Gen. Pl. p. 110.—Sm. Gram. of Bot. p. 99.; Engl. Fl. v. iii. p. 63.—Bentham, in Bot. Regist. (1829.)—Lindl. Syn. p. 196.; Introd. to Nat. Syst. of Bot. p. 239.—Rich. by Macgilliv. p. 439.—Loud. Hort. Brit. p. 528.—Don's Gen. Syst. of Gard. and Bot. v. iv. p. 665.—Mack. Fl. Hibern. p. 209.—Hook. Brit. Fl. (4th edit.) p. 415.—VERTICILLATÆ of *Linnæus*.—SYRINGALES; suborder, PRIMULOSÆ; sect. MENTHINÆ; type, MENTHACEÆ or LABIATAE; subtype, SATURIDÆ; Burn. Outl. of Bot. v. ii. p. 900, 958, 968, & 972.

**GEN. CHAR.** *Whorls* few-flowered. *Calyx* (fig. 1.) of 1 sepal, tubular, 13-ribbed, gibbous at the base below, 2-lipped, closed at the throat with converging hairs; upper lip broadish, flattish, with 3 sharp teeth; lower lip of 2 longer, equal, narrow, awl-shaped teeth. *Corolla* (fig. 2.) of 1 petal, ringent; tube as long as the calyx; throat short, but little dilated; upper lip shortest, flat, erect, blunt, with a small notch; lower lip longer and broader, spreading, in 3 deep blunt lobes, the middle lobe the broadest, slightly emarginate. *Filaments* (see fig. 3.) 4, didynamous, shorter than the corolla, slender, incurved. *Anthers* distinctly 2-lobed. *Germen* (see fig. 4.) 4-cleft. *Style* thread-shaped. *Stigma* in 2 acute segments. *Seeds* (see fig. 5.) 4, small, roundish, in the bottom of the closed calyx.

The few-flowered *whorls*; the 2-lipped, 13-ribbed, tubular *calyx*, gibbous at the base below, with 5 unequal teeth, and a hairy throat; and the *corolla* with the upper lip nearly flat, and the lower one 3-lobed, with the middle lobe nearly entire; will distinguish this from other genera in the same class and order.

It differs from *Thymus* (t. 127.) in the stamens being ascending and incurved, not distant; and from that and *Calamintha* in the gibbous base of the calyx.

One species British.

A'CINOS VULGA'RIS. Common Basil-Thyme. Small Wild Basil. Basil Balm. Stone Basil.

**SPEC. CHAR.** Stems ascending, branched. Leaves on short petioles, egg-shaped, acute, slightly serrated, more or less ciliated at the base. Flowers about 6 in a whorl, on simple stalks.

LOCALITIES.—On dry hills, waste places, and in cultivated fields, especially on a sandy, gravelly, or chalky soil. Not uncommon in ENGLAND and WALES; more rare in SCOTLAND; not found in IRELAND?

Annual.—Flowers in July and August.

*Root* small, somewhat woody, fibrous. *Stems* from 6 inches to a foot long, spreading, ascending, oppositely branched from the base, bluntly 4-angled, clothed, all over, with short, soft, white, recurved hairs, which are most dense on two opposite sides, alternating between the joints. *Leaves* opposite, on short winged petioles, egg-shaped, acute, the upper ones somewhat approaching to spatulate, all bluntly serrated above the middle, their margins slightly revolute, and more or less ciliated; dark green, and slightly hairy above, paler beneath, with hairy veins, and very minute, mealy glands. *Flowers* on short, simple, hairy pedicels, in distant, axillary, 6- to 8-flowered whorls, with very minute ciliated *bracteas* at their base. *Calyx* (fig. 1.) tubular, protuberant at the base on the under side, covered with very minute, resinous glands; 13-ribbed, the ribs with a single row of short, white, slightly incurved bristles; 2-lipped, the segments unequal, 3 upper ones shortest, triangular, recurved; 2 lower ones awl-shaped, straighter or incurved, all fringed on the margins; mouth closed with an appendage of long white hairs, which also appear on the interior surface of the 3 upper segments, whilst that of the 2 lower ones is smooth. *Corolla* (fig. 2.) hairy, bluish-purple, upper lip short, blunt, emarginate; lower lip 3-lobed, lateral lobes rounded, entire, central one broader, with a shallow notch, and a roundish, dark-purple spot in front near the base; throat white, with short, thick, white hairs within on the lower side. *Seeds* oblong, 3-sided, smooth.

It is sometimes found with white flowers.

*Acinos vulgaris* is a native of other parts of Europe besides Britain, as Sweden, Portugal, Naples, Greece, about Petersburgh, and of the Caucasus.

The whole plant has a pleasant aromatic smell, but commonly much weaker than in *Thymus Serpyllum*, t. 127.

*Arrhenatherum avenaceum*. Oat-like grass 2  
Nathorn & D. G. Sc. Inst. of W. Barts Botanic Garden. Record 2522

## ARRHENATHE'RUM\*.

*Linnean Class and Order.* TRIA'NDRIA†, DIGY'NIA.

*Natural Order.* GRAMI'NEÆ, Juss. Gen. Pl. p. 28.—Sm. Gram. of Bot. p. 86.; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293.; Introd. to Nat. Syst. of Bot. p. 292.—Rich. by Macgilliv. p. 393.—Loud. Hort. Brit. p. 542.—Mack. Fl. Hibern. p. 294.—Hook. Brit. Fl. (4th edit.) p. 426.—GRAMINA, Linn.—GRAMINALES; sect. FESTUCINÆ; type, AVENACEÆ; Burn. Outl. of Bot. v. i. pp. 359 and 369.

**GEN. CHAR.** *Inflorescence* panicled. *Panicle* loose. *Spikelets* (see fig. 1.) 2-flowered; upper floret perfect, lower with stamens only. *Calyx* (fig. 2.) of 2 unequal, awnless glumes, shorter than the paleæ, 2-flowered. *Corolla* (fig. 3.) of 2 unequal paleæ, the larger emarginate, of the staminiferous floret, with a twisted awn above the base; of the perfect floret (see fig. 3.) with a short, straight bristle below the point; the smaller narrower, and awnless. *Nectary* (fig. 4.) a cloven, smooth, membranous scale. *Filaments* (see fig. 3.) 3 in each floret. *Anthers* notched at each end. *Styles* (see fig. 5.) short, widely spreading. *Stigmas* (see fig. 5.) large, feathery. *Seed* (fig. 7.) coated with the hardened, permanent corolla (see fig. 6).

The loose *panicle*; the 2-flowered *calyx*, of 2 unequal glumes; the lowermost floret with stamens only, and a long twisted awn above the base, and the upper one perfect with a short, straight bristle below the point; will distinguish this from other genera in the same class and order.

One species British.

ARRHENATHE'RUM AVENA'CEUM. Common Oat-like Dog-grass. Oat-like Soft-grass.

**SPEC. CHAR.**

LOCALITIES.—In pastures, hedges, and by road-sides; common.

Perennial.—Flowers in June and July.

*Root* fibrous, downy, knotty, from the swollen joints of the base of the culm. *Culm* from 2 to 3 feet high, or more, smooth, simple, leafy, jointed, the joints usually smooth, but sometimes downy. *Leaves* of the culm 6 or 7 inches to a foot long, and about a quarter of an inch broad, striated, rough, especially at the margins, their upper surface with a few scattered, slender, white hairs. *Sheaths* long, striated, smooth, with a few long, deflexed hairs on the margin at their summits, just below the stipula. *Stipula (ligula)* short, blunt. *Panicle* long, upright, or a little drooping, loose, shining; its branches numerous, rough, unequal, half-whorled, and directed to one side. *Calyx-glumes* nearly white, almost transparent; the *inferior one* smallest, spear-shaped, single-nerved, nearly smooth, with a rough keel; *superior one* larger, about as long as the florets, pointed, bifid, with 3 rough, reddish-green ribs. *Paleæ of the Corolla* of nearly the same shape as the glumes of the calyx, but larger; the lower floret (fig. 1, b.) least perfect, but most conspicuously awned; their inner paleæ narrow, membranous, and flat. *Anthers* strap-shaped, cloven, hanging out at one side. *Styles* very short. *Stigmas* (fig. 5.) long, spreading horizontally, feathery on the upper side. *Seed* (fig. 7.) nearly cylindrical, coated with the hardened corolla (see fig. 6).

*Arrhenatherum bulbosum*, of DUMORTIER, LINDLEY, and some other authors, differs from this only in being a larger plant with a bulbous base to the culm, and occasionally hairy joints.

The produce of this grass is said to be very great, but it is so excessively bitter as to be unpalatable to cattle in general; and the bulbous-rooted variety is a very troublesome weed when it occurs on arable land; nevertheless, the animated description of Miss KENT, has conferred on it no inconsiderable degree of interest. “I have seen it,” observes that elegant writer, (in *Loud. Mag. Nat. Hist.* v. i. p. 237.), “six feet high, with leaves two feet long, and more than one inch wide, with its panicle of flowers gently drooping to one side, at least one foot six inches in length, and so finely polished, that, but for their green colour, we might think it was composed of silver oats. Yet it is *not* green; neither is it white, nor gold-colour, nor purple, but it is a union of all these: it is the offspring of silver and of gold, of the amethyst and the emerald. It is, indeed, very variable; but, in the full pride of its beauty, this grass is truly magnificent. The light purple pyramids that quiver in every field and meadow, must be well known to every reader. In fine, the student who has leisure to investigate their beauties, will find the family of grasses peculiarly interesting, and much more various and beautiful than, from the apparent homeliness of many, they might be supposed to be.”

Tamarix Gallica. French Tamarisk. 2

Author T. H. G. S.

Pub'd by W. Baxter, Botanic Garden, Oxford, 1810

## TA'MATRIX \*.

*Linnean Class and Order.* PENTA'NDRIA†, TRIGY'NIA.

*Natural Order.* TAMARISCI'NEAE, Desvaux.—Lindl. Syn. p. 61.; Introd. to Nat. Syst. of Bot. p. 158.—Rich. by Macgilliv. p. 527.—Loud. Hort. Brit. p. 514.—Don's Gen. Syst. of Gard. and Bot. v. ii. p. 725.—Hook. Brit. Fl. (4th ed.) p. 406.—TAMARICA'-CEE, Loud. Encycl. of Trees and Shrubs, p. 457.—PORTULACEAE, Juss. Gen. † See folio 48, note †.

**LOCALITIES.**—On the rocks, and cliffs, and sandy shores, of the southern and western coasts of England.—*Cornwall*; Plentiful on St. Michael's Mount, and everywhere about the Lizard Point, but chiefly on the banks of earth called hedges: Mr. GIDDY. Apparently planted in every station observed: Mr. H. C. WATSON, in N. B. G.—*Hants*; On the beach near Hurst Castle, and Freshwater: Dr. PULTENEY.—*Kent*; It forms the ornament of Sandgate, flourishing upon its sandy banks, and flowering thrice within the year: Rev. G. E. SMITH.—*Suffolk*; By Languard Fort: Sir T. G. CULLUM.—*Sussex*; On the Cliff to the East of Hastings: Rev. Dr. GOODENOUGH. Also West of the old town, doubtless planted: *Bot. of Suss.* and N. B. G.

### A Shrub.—Flowers in July.

*Root* branched. *Stem* slender, from 5 to 14 or 16 feet high, sometimes higher, very much branched; older branches long, slender, twiggy, drooping, red, and shining, with scattered, sessile scales; younger branches herbaceous, slender, bright green. *Leaves* very small, egg-shaped, or egg-spear-shaped, pointed, scattered or imbricated, smooth, deciduous, with a loose spur at the base. *Spikes* lateral and terminal, somewhat panicled, dense, cylindrical, slender, of numerous, nearly sessile, reddish or white, bracteated, scentless flowers.

This elegant Shrub is frequent in sandy places in France, on the shores of the Mediterranean Sea, and of the Atlantic Ocean, as far as Poictiers; also found upon the banks of rivers in the South of Europe, North of Africa, and West of Asia. It is likewise a native of Tartary, Barbary, the Himalayas, and Japan. It is the *Myrica* of the Greeks, and the *Tamarix* of the Latins; and DIOSCORIDES mentions it as being effective in various diseases. Its bark is slightly bitter, and astringent; and its ashes contain a large quantity of Sulphate of Soda. In the South of Russia, and in Tartary, it assumes a great variety of form, according to the soil and situation; the tops of the dwarf plants are there eaten by sheep, in preference to all other food; and the stems of the larger ones are used as handles for whips. EVELYN tells us, that it was considered of old one of the unfortunate trees, and under malediction, and therefore used for wreaths to put round the heads of malefactors. He says also, that drinking-canns were made of the wood: and it is spoken of as affording brooms to the housewife. W. BROWNE says—

“ Amongst the rest the tamariske there stood,  
For housewives' besomes onely knowne most good.”

The *Tamarisk* has been celebrated in the verses of most of the ancient poets. HOMER mentions it as the tree against which ACHILLES laid his spear before he plunged into the Xanthus, to pursue the flying Trojans.

“ So plunged in Xanthus by Achilles' force,  
Roars the resounding surge with men and horse.  
His bloody lance the hero casts aside,  
(Which spreading tamarisks on the margin hide).”

• Pope's *Hom. Il. B. xxi. l. 18—21.*

It is introduced in the *Pastorals* of THEOCRITUS; and VIRGIL has noticed it several times in his *Eclogues*. Its name may also be found in several of the poems of OVID.

The **TAMARISCINEÆ** are polypetalous dicotyledonous *shrubs*, with rod-like branches; small scale-like leaves; a 4- or 5-parted, permanent *calyx*, imbricated in the bud; a *corolla* of 4 or 5 petals, inserted into the base of the calyx; with 4, 5, 8, or 10 *stamens*, which are either free or united by their filaments. The *ovary* is free; the *capsule* 3-sided, 3-valved, 1-celled, and many-seeded, with 3 *placentas* (*receptacles*) at the base of the cell, or along the middle of the valves. *Seeds* comose (tufted), without *albumen*.

*Tamarix* is the only British genus in the order.

## AMARA'NTHUS\*.

*Linnean Class and Order.* MONOE' CIA†, PENTA'NDRIA.

*Natural Order.* AMARANTHA'CEÆ, R. Brown, Prod. p. 413.—Lindl. Syn. p. 213.; Introd. to Nat. Syst. of Bot. p. 165.—Rich. by Macgilliv. p. 426.—Loud. Hort. Brit. p. 530.—Hook. Brit. Fl. (4th ed.) p. 416.—AMARANTHI. Juss. Gen. Pl. p. 87.—QUERNEALES; sect. RUMICINÆ; type, BETACEÆ; subty. AMARANTIDÆ; Burn. Outl. of Bot. v. ii. pp. 523, 587, 591, & 593.—MISCELLANÆ, Linn.

**GEN. CHAR.** *Flowers* monœcious. *Sterile Flowers* (fig. 1). *Calyx* of 3, or 5, upright, elliptic or spear-shaped, coloured, permanent sepals. *Corolla* none. *Filaments* (see fig. 1.) 3 or 5, hair-like, upright, not longer than the calyx, opposite to its segments. *Anthers* oblong, versatile, of 2 lobes.—*Fertile Flowers* (fig. 2.) in the same cluster with the sterile ones. *Calyx* the same. *Corolla* none. *Germen* (see fig. 2.) superior, egg-shaped. *Styles* (see fig. 2.) 3, sometimes but 2. *Stigmas* undivided, pointed, downy on the upper side. *Capsule* (fig. 3.) egg-shaped, thin, crowned with the remains of the styles, bursting all round (see fig. 4.), of 1 cell. *Seed* (figs. 5 & 6.) solitary, globose, compressed, filling the capsule.

The 3- or 5-sepaled *calyx*; the want of a *corolla*; the *sterile flowers* with 3 or 5 *stamens*; and the *fertile ones* with 3 *styles*; 3 *stigmas*; and a 1-celled, 1-seeded *capsule*, opening by a transverse incision; will distinguish this from other genera in the same class and order.

One species British.

AMARA'NTHUS BLITUM. Blite Amaranth. Wild Blite. Small Garden Blite. Small Red Blite.

**SPEC. CHAR.** Flowers 3-cleft and triandrous, in small lateral clusters. Leaves egg-shaped, blunt. Stem spreading.

Engl. Bot. t. 2212.—Linn. Sp. Pl. p. 1405.—Huds. Fl. Angl. (2nd ed.) p. 418.—Willd. Sp. Pl. v. iv. pt. i. p. 387.—Sm. Fl. Brit. v. iii. p. 1018.; Engl. Fl. v. iv. p. 137.—With. (7th ed.) v. ii. p. 208.—Lindl. Syn. p. 213.—Hook. Brit. Fl. p. 404.—Macr. Man. Brit. Bot. p. 193.—Relh. Fl. Cant. (3rd ed.) p. 392.—Winch's Fl. of Northumb. and Durh. p. 61.—Irv. Lond. Fl. p. 284.—*Amaranthus minor*, Gray's Nat. Arr. v. ii. p. 289.—*Blitum rubrum minus*, Ray's Cantab. p. 23.—Dill. in Ray's Syn. p. 157.—Bauh. Hist. v. ii. p. 967, with a figure.—Johnson's Gerarde, p. 321. f. 4.—*Small Garden Blite*, Petiv. H. Brit. t. 7. f. 9.—*Blitum minus sylvestre rubrum*, Park. Theatr. p. 753. f. 2.

**LOCALITIES.**—On low waste ground, and near dunghills; very rare.—Cambridgeshire; Near Parker's Piece. Barnwell, by the side of the road leading to Hinton: Rev. R. RELHAN.—Dorset; On rubbish, and about old walls; at

Weymouth, about the quay, and elsewhere; at Poole: Dr. PULTENEY.—*Durham*; On Hebburn, Jarrow, and Sunderland Ballast-hills: N. J. WINCH, Esq.—*Huntingdonshire*; At Ripton: Mr. WOODWARD.—*Kent*; Tunbridge Wells: *Fl. Tunb.*—*Middlesex*; About London: *Engl. Fl.* Walham Green: N. J. WINCH, Esq. Gathered once near Stoke Newington by J. Woods, jun.: B. G.—*Northumberland*; On Willington Ballast-hills: N. J. WINCH, Esq.—*Surrey*; Battersea Fields, towards Vauxhall: Mr. W. PAMPLIN, jun.

#### Annual.—Flowers in August.

*Root* tapering, fibrous. *Stems* several, trailing, branched, leafy, widely spreading, round, furrowed, smooth. *Leaves* alternate, on longish petioles, egg-shaped, or somewhat rhomboid, more or less blunt, roughish at the edges only, sometimes white or silvery in the middle, with or without a brown spot. *Flowers* numerous, green, crowded, tufted, in small, axillary, leafy clusters. *Calyx* of 3 oblong, bluish, green, membranous sepals. *Stamens* 3. *Seeds* black and shining.

This plant is a native of all Europe, except the very cold parts, Japan, &c., in cultivated grounds, on dunghills, banks, among rubbish, &c. Mr. LOUDON, in his “*Hortus Britannicus*,” describes 60 species of this genus, many of which are very beautiful, and have been long cultivated as ornaments to the flower garden. Amongst them are, *Love-lies-bleeding* (*Amaranthus candatus*), *Prince's Feather* (*A. hypochondriacus*), & *Tricolors* (*A. tricolor*).

---

The *Natural Order AMARANTHACEÆ* consists of herbaceous, or somewhat shrubby, apetalous, dicotyledonous plants, with opposite or alternate leaves, without *stipulae*. The flowers are small, usually coloured, sometimes monœcious, but more usually perfect; and disposed in spikes, or heads. The *calyx* is inferior, of 3 or 5 scarious, permanent sepals, occasionally with two bracteas at the base. The *stamens* are hypogynous (growing from below the base of the germen), either 3 or 5, or some multiple of 5; with either distinct or united filaments; and 2-celled, or 1-celled *anthers*. The *ovary* (*germen*) (see fig. 2.) is single, superior, of 1 or 2 cells, with 1 or few *ovules* (*young seeds*). The *styles* (see fig. 2.) are either 1, (or 3,) or none; with simple or compound *stigmas*. The *capsule* (see figs. 3 & 4.) is 1-celled. The *seeds* are lens-shaped, often stalked and pendulous; with a crustaceous *testa*; a central, farinaceous *albumen*; and a cylindrical, elongated *embryo*, which is curved round the circumference (see fig. 7).

---

“ It is difficult,” says Professor LINDLEY, in his elegant work, the *Ladies' Botany*, “ to mention an order much more simply constructed than this, and yet how perfectly are all the parts adapted to the end for which they are created. Even a provision for a beautiful appearance is not neglected, for in order to compensate for their smallness, we find the flowers developed in large masses, and aided by multitudes of shining bracts, which contribute very essentially to their fine appearance.”

Their virtues are nutritive, emollient, and demulcent; they are all harmless, and many of the species may be used as pot-herbs.—*Amaranthus* is the only British Genus in the order.

*Chærophyllum temulentum* Rough Chervil. 3

Mathews Del & Sc.

Pubd by W. Macbr. in the Botanic Garden Oxford 1819

## CHÆROPHYLLUM\*.

*Linnean Class and Order.* PENTA'NDRIA †, DIGY'NIA.

*Natural Order.* UMBELLIFERÆ ‡, Juss. Gen. Pl. p. 218.—Sm. Gram. of Bot. p. 132.—Lindl. Syn. p. 111.; Introd. to Nat. Syst. of Bot. p. 4.—Rich. by Macgilliv. p. 463.—Loud. Hort. Brit. p. 517.—Don's Gen. Syst. of Gard. & Bot. v. iii. p. 235.—Mack. Fl. Hibern. p. 113.—Hook. Brit. Fl. (4th ed.) p. 408.—UMBELLATÆ, Linn.—ROSALÆ; sect. ANGELICINÆ; type, SMYRNIACEÆ; subtype, SCANDICIDÆ; Burn. Outl. of Bot. pp. 614, 770, 780, & 781.

**GEN. CHAR.** Flowers imperfectly separated. *Calyx* an obsolete margin. *Corolla* (see fig. 1.) of 5 inversely egg-shaped, emarginate petals, with an inflexed point. *Filaments* (see fig. 1.) 5, thread-shaped, spreading, as long as the petals. *Anthers* roundish. *Germen* (fig. 2.) inferior, oblong, somewhat club-shaped, blunt, furrowed, smooth, slightly compressed. *Styles* (see fig. 2.) 2, awl-shaped, a little spreading, very tumid at the base. *Stigmas* blunt. *Floral Receptacle* wanting. *Fruit* (see fig. 3.) without a beak, compressed or contracted at the sides. *Carpels* with 5 obtuse equal ribs, of which the two lateral ones form a margin; the commissure (face) with a deep furrow. *Interstices (channels)* with a single *vitta* in each. *Seed* taper, (round and long,) its transverse section halfmoon-shaped.—*Universal involucrum* wanting, or of few leaves; *partial involucrum* of many leaves.

The obsolete *calyx*; the superior *corolla*, of 5 inversely egg-shaped, emarginate, inflexed petals; the smooth, elongated, narrow, laterally compressed or contracted *fruit*, without a beak; the *carpels* with 5 blunt equal ribs, with a single *vitta* in each *channel*; and the *commissure* with a deep furrow; will distinguish this from other genera in the same class and order.

Three species British.

CHÆROPHYLLUM TEMULE'NTUM. Intoxicating Cow-parsley. Rough Cicely. Wild Chervil. Small Cow-parsley.

**SPEC. CHAR.** Stem rough, spotted, swollen below the joints. Leaves bipinnate; leaflets egg-shaped, slightly acuminate Partial *involucrum* reflexed. Fruit nearly smooth.

LOCALITIES.—In hedges, and bushy places; common.

Biennial.—Flowers in June and July.

*Root* spindle-shaped, somewhat branched, whitish. *Stem* from 2 to 3 feet high, upright, branched, round, solid, striated, rough with deflexed hairs, and spotted with dark purple; swollen under each joint. *Leaves* alternate, dark green above, paler beneath, hairy, twice pinnate; leaflets somewhat egg-shaped, lobed, and cut. *Petioles* dilated and clasping at the base. *Umbels* of many hairy unequal rays; the *partial* ones smooth, drooping when young. *Universal involucrum* either entirely wanting or of one leaf; rarely of many. *Partial Involucrum* of several egg-shaped, pointed, somewhat membranous or coloured leaves, finely fringed on their margins and keel, and occasionally confluent at the base. *Flowers* white, numerous, very slightly irregular, partly sterile; those of the circumference principally fertile. *Petals* (see fig. 1.) heart-shaped from the inflexion of their points. *Germen* (see fig. 2.) club-shaped, smooth. *Styles* decurved, shorter than their globose base. *Stigmas* blunt. *Fruit* (fig. 3.) somewhat strap-shaped, striated, and nearly smooth.

The whole plant is sweetish and aromatic, and is acceptable to domestic cattle, nor is any intoxicating quality recorded, notwithstanding the specific name. The herbage is often mildewed. (See SM. Engl. Fl.). The roughness, dark purple spots, and swollen joints of the stem, will distinguish it from most other of the British *Umbelliferae*.

---

" RANGE thro' the fields in Spring's enchanting hours,  
And mark the beauties that are spread around !  
Lo, how the Summer doth bedeck the ground  
With choicest store of blooming fruits and flow'rs !  
See how the yellow Autumn amply show'rs  
Her gifts, that with glad plenteousness abound !  
In gloomy Winter too, use may be found,  
For then the earth doth renovate her pow'rs !  
Ponder on all these things !—Do they not raise,  
With one accord, an universal song  
To their great Author, of mute thanks and praise ?  
Do they not speak, in accents wond'rous strong,  
The pow'r and greatness of His mighty ways ?  
The speechless thanks that to His name belong ?"

Elyna caricina Carex-like Elyna 2

Matthews No 332

Publ by W. Black, 19<sup>th</sup> Century, Oxford.

## ELY'NA \*.

*Linnean Class and Order.* MONC'IA †, TRIA'NDRIA †.

*Natural Order.* CYPERA'CEÆ §, Juss.—Lindl. Syn. p. 278.; Introd. to Nat. Syst. of Bot. p. 304.—Rich. by Macgilliv. p. 392.—Loud. Hort. Brit. p. 541.—Mack. Fl. Hibern. p. 318.—Hook. Brit. Fl. (4th ed.) p. 427.—CYPEROIDEÆ, Juss. Gen. Pl. p. 26.—Sm. Gr. of Bot. p. 68.—CYPERALES; sect. CARICINÆ; type, CARICACEÆ; Burn. Outl. of Bot. v. i. pp. 354 & 358.—CALAMARIAE, Linn.

**GEN. CHAR.** *Spikes* terminal, compound, monœcious. *Spikelets* (fig. 1.) 2-flowered, upper one (fig. 1, c.) *sterile*, lower one (fig. 1, b.) *fertile*, both included in a broad sheathing *bractea* (fig. 1, a). *Sterile Flower* (fig. 2). *Calyx* a single, oblong, involute, permanent scale, sometimes wanting. *Corolla* none. *Filaments* (see fig. 2.) 3, hair-like, upright, longer than the *calyx* or *scale*. *Anthers* vertical, strap-shaped, upright, of 2 cells. *Fertile Flower* (fig. 3). *Calyx* as in the sterile flower. *Corolla* none. *Germen* (fig. 3, b.) superior, triangular. *Style* (fig. 3, c.) 1, cylindrical. *Stigmas* (fig. 3, d.) 3, tapering, spreading, downy. *Seed or Nut* (figs. 4 & 5.) 1, somewhat triangular, pointed, hard, naked, except the permanent scale (fig. 3, a.) which shelters it.

The 2-flowered *spikelets*, with their upper flower *sterile*, and their lower one *fertile*, each with a *calyx* of one involute scale (see fig. 1, b and c.), without a *corolla*; and both included in a broad sheathing *bractea* (fig. 1, a.); and the single, somewhat 3-cornered, naked *seed* or *nut*; will distinguish this from other genera in the same class and order.

It differs from *Carex* (t. 440.) in the seed being naked; and in the absence of a *corolla* in the fertile flowers.

One species British.

**ELY'NA CARICI'NA.** Carex-like Elyna. Compound-headed Elyna.

**SPEC. CHAR.** Spikelets aggregate, compound.

Mert. and Koch. Fl. Germ. v. i. p. 459.—Hook. Brit. Fl. p. 401.—Winch's Fl. of Northumb. and Durh. p. 61.—Irv. Lond. Fl. p. 284.—Baines' Fl. of Yorkshire, p. 112.—*Kobrésia caricina*, Willd. Sp. **LOCALITIES.**—On mountains, in moist muddy spots; very rare.—*Devonshire*, Broad Clyst. Haldon, plentiful: Mr. JACOB.—*Durham*: On the Widdy Bank in Teesdale Forest; also on Cronkley Fell: Aug. 25, 1799; Mr. DICKSON, and N. J. WINCH, Esq.; to whom it was pointed out by the Rev. J. HARRIMAN.

Fig. 1. A Spikelet; a, a bractea; b, fertile floret; c, sterile one.—Fig. 2. A separate Sterile Floret.—Fig. 3. A separate Fertile Floret; a, the calyx or scale; b, germen; c, style; d, stigma.—Figs. 4 & 5. Seed.—All, except fig. 1, magnified.

\* From *elyo*, Gr. to cover; which the scale does the flower.

† See fol. 83, note †.      ‡ See fol. 56, note †.      § See fol. 436, g.

Teesdale: June, 1842; W. BORRER, Esq.—*Westmoreland*; In Birkdale: Rev. J. HARRIMAN, in B. G.—*Yorkshire*; On Cronkley Fell, at 2000 feet elevation: R. B. BOWMAN, in N. B. G.—SCOTLAND. *Perthshire*; Near the summit of Schroine ach Lochen; a mountain south of Mael Ghyrdy: August, 1827; W. WILSON, Esq., in *Hooker's Botanical Miscellany*, v. i. p. 84. “I gathered it somewhere on the Breadalbane Mountains, and incline to suppose it was on Ben More:” Mr. H. C. WATSON, in N. B. G.

Perennial.—Flowers in August.

Root fibrous, tufted. *Culms* (*stems*) solitary, simple, naked, from 2 to 6 inches high, striated, smooth, roundish towards the base, angular, and rough-edged, at the top. *Leaves* several, radical, spreading or recurved, very slender, strap-shaped, channelled on the upper surface, slightly keeled on the under, pointed, striated, smooth, rough-edged, shorter than the culm; their longish *sheaths* closely embracing its base, each crowned with a short, brownish, membranous *stipula*. *Spike* terminal, compound, somewhat egg-shaped, upright, not an inch long, having a short, sheathing, brown, membranous *bractea*, or two, at its base. *Spikelets* alternate, small, brown, usually 2-flowered. *Germen* oblong, scarcely 3-cornered. *Style* simple. *Stigmas* 3, strap-shaped, downy. *Seed* without any other covering than the scale (see fig. 3, *a.*), oblong, somewhat triangular, horny, smooth, crowned with the base of the style.

This singular little plant is, in habit, nearly allied to *Scirpus*, and still more closely to *Blyssmus*, t. 308; but the flowers are monœcious. From *Carex* it differs in not having the inflated corolla. It is a native of Switzerland as well as of Britain. Sir J. E. SMITH found it on Mount Cenis in August, 1787, but kept it unsettled in his Herbarium till 1799, in which year it was gathered in the county of Durham by Mr. DICKSON, to whom, Sir JAMES informs us, is due the honour of making it known. The Rev. Mr. HARRIMAN had found it in 1797; but not being aware of its novelty, he liberally disclaimed the merit of the discovery. See *Engl. Bot.* fol. 1410.

The drawing for the accompanying plate was made from a specimen kindly communicated to me by W. BORRER, Esq., who gathered it in Teesdale in June last.

---

“ Every tree,  
And bush, and fragrant flower, and hilly path,  
And thymy mound that flings unto the winds  
Its morning incense, is—my friend; for I  
Did make acquaintance with inanimate things  
In very boyhood, and did love to break  
With shouts the mountain silence, and to hang  
O'er flashing torrents, when the piny boughs  
Shook their dark locks, and plained in mournful tones  
Mysterious to the barren wilderness;  
And still, in solitary spots, my soul  
Resumes its youth . . . . Think not that this is all  
An idle folly; He who can draw a joy  
From rocks, or woods, or weeds, or things that seem  
All mute (and does’t)—is wise.”

\* From *Castanea*, a town in Thessaly; or from another town of that name in Pontus.

† See fol. 83, note †.

LOCALITIES.—In woods, plantations, and hedges, mostly in the South and West of England ; a doubtful native.

Tree.—Flowers in May.

A stately and majestic tree ; attaining, in favourable situations, the height of 60 or 80 feet. Bark with remarkably deep clefts. Branches widely spreading, round and smooth when young. Leaves alternate, on short petioles, elliptic-spear-shaped, sharp pointed, 5 or 6 inches long, and 2 broad, smooth, with many transverse veins, ending in sharp, somewhat spinous-pointed, serratures ; of a rich shining green above, paler beneath. Sterile Catkins numerous, axillary, solitary, yellow, pendulous ; from 4 to 6 or 7 inches long, deciduous. Flowers ranged along the common stalk of the catkin, in lateral sessile tufts (see fig. 1). Stamens numerous, long, and spreading.—Fertile Flowers (see figs. 3 & 4.) much fewer than the sterile ones, and placed on terminal stalks, which are lengthened out as the fruit advances. Styles (see fig. 4.) about 6, with long, smooth, upright stigmas. GERTNER detected about 12 scarlet rudiments of stamens, among the wool at the base of the styles. Nuts (see fig. 6.) large, broadly egg-shaped, usually 2 ; flat on the inner side, and each attached by a broad scar to the bottom of the greatly enlarged involucrum (see fig. 6.) the outside of which is copiously armed with complicated sharp prickles. See Sm. Engl. Fl.

The sweet Chestnut is by some considered to be indigenous in Britain ; but, notwithstanding the great age of some specimens, it appears, from the observations of the Hon. DAIRIS BARRINGTON, and others, more than probable that they have all been planted. Mr. LOUDON observes, that the wood of this tree has the remarkable property of being more durable when it is young than when it is old ; the sap or outer wood very soon changing into heart wood ; and hence the great value of this tree for posts, fencing-poles, stakes, trellis-work, hoops, &c. (*Encycl. of Tr. & Sh.*) It was once very generally supposed, that the roofs of some of our Cathedrals, and many of the oldest buildings in London were constructed of Chestnut, but it has been shown by DAUBENTON and others, that these roofs and buildings are formed of the wood of the sessile-fruited Oak, (*Quercus sessiliiflora.*) which, when old, resembles the Chestnut. (*Cowell's Fl. Guide.*) The nuts constitute a great part of the food of the common people in the South of France and the North of Italy ; where they are used either roasted or boiled, and also ground into meal, and made into cakes, bread, and puddings. In England they are roasted, and served up as a dessert ; they are said also formerly to have accompanied the wassail bowl in the celebration of Christmas festivals. These nuts are also used for whitening linen cloth, and for making starch. Deer are fond of Chestnuts ; hence they are sometimes called Buck-mast. Some instances are recorded in which the Chestnut is said to have arrived at a most extraordinary size and age, such as the *Castagno de cento cavalli*, on Mount Etna, the trunk of which, according to the account given of it by Mr. HOUEL, is 160 feet in circumference. A figure of this tree may be seen in BURNETT's *Outlines of Botany*, v. i. p. 57. The oldest Chestnut tree in England is, I believe, in the garden of Lord DUCIE, at Tortworth, in Gloucestershire ; the circumference of its trunk, in 1820, was 52 feet ; and it is supposed to be more than 1000 years old. A portrait of this ancient tree, and also of a very old one at Cobham, Kent, is given in Mr. LOUDON's excellent work, the *Arboretum et Fruticetum Britannicum*, at pages 1988 & 1989.

The CUPULIFERÆ are apetalous, dicotyledonous *Trees or Shrubs*, with alternate, stipulate, simple, penninerve leaves ; and monoecious flowers. Sterile flowers amentaceous ; fertile ones aggregate or amentaceous. Ovaries seated within a coriaceous involucrum (*capsule*) of various figure, and with several cells (see fig. 5.) and several ovules, the greater part of which are abortive. Ovules pendulous, either solitary or two together. Fruit a bony or coriaceous, 1-celled nut, more or less inclosed in the involucrum.—The British genera are, *Fagus*, t. 331.—*Castanea*, t. 485.—*Quercus*, t. 371.—*Corylus*, t. 338.—*Carpinus*, t. 234.

Calamintha nepeta Lepid. Calamint. 4

Calamintha

Pub'd by W. Bullock, Botanic Garden, Bristol, 1820.

## CALAMINTHA\*.

*Linnean Class and Order.* DIDYNA'MIA †, GYMNOSPE'RMIA ‡.

*Natural Order.* LABIATÆ §, Juss. Gen. Pl. p. 110.—Sm. Gram. of Bot. p. 99.; Engl. Fl. v. iii. p. 63.—Bentham, in Bot. Regist. (1829.)—Lindl. Syn. p. 196.; Introd. to Nat. Syst. of Bot. p. 239.—Rich. by Macgilliv. p. 439.—Loud. Hort. Brit. p. 528.—Don's Gen. Syst. of Gard. and Bot. v. iv. p. 665.—Mack. Fl. Hibern. p. 209.—Hook. Brit. Fl. (4th edit.) p. 415.—VERTICILLATÆ of *Linnæus*.—SYRINGALES; suborder, PRIMULOSÆ; sect. MENTHINÆ; type, MENTHACEÆ or LABIATÆ; subtype, SATURIDÆ; Burn. Outl. of Bot. v. ii. p. 900, 958, 968, & 972.

**GEN. CHAR.** *Flowers* axillary, somewhat solitary, or often in loose bracteated cymes. *Calyx* (fig. 1.) inferior, of 1 sepal, tubular, 13-ribbed, nearly equal at the base, 2-lipped; upper lip of 3 sharp teeth; lower lip of 2 longer, equal, narrow, awl-shaped teeth; the throat hairy inside (see fig. 6). *Corolla* (fig. 2.) of 1 petal, ringent; tube as long as the calyx, or longer; throat but little dilated; upper lip shortest, nearly flat, upright, blunt, with a small notch; lower lip longer and broader, spreading, in 3 deep, blunt lobes, the middle one broadest, with a shallow notch. *Filaments* (see fig. 3.) 4, didynamous, shorter than the corolla, slender, incurved. *Anthers* distinctly 2-lobed. *Germen* (see fig. 4.) 4-cleft. *Style* thread-shaped. *Stigma* in 2 acute segments. *Seeds* (see fig. 5.) 4, small, roundish, in the bottom of the closed, permanent calyx.

The *flowers* in loose bracteated cymes; the tubular, 13-ribbed, 2-lipped *calyx*, nearly equal at the base, with 5 unequal teeth, and a hairy throat; the *corolla* with the upper lip nearly flat, and the lower one 3-lobed, with the middle lobe emarginate; and the incurved *stamens*; will distinguish this from other genera in the same class and order.

It differs from *Thymus* (t. 127.) in the stamens being ascending and incurved, not distant; and from *Acinos* (t. 479.) in the base of the calyx being nearly equal, not gibbosus.

Two species British.

**CALAMINTHA NE'PETA.** Cat-mint Balm. Lesser Calamint. Three-forked Calamint. Field Calamint.

**SPEC. CHAR.** Whorls on forked, many-flowered stalks, longer than the adjoining leaf. Leaves serrated. Hairs in the mouth of the calyx prominent.

### Perennial.—Flowers in July and August.

*Root* branched, woody, round, and fibrous. *Stems* many, ascending, from 1 to 2 feet long, much branched, obscurely 4-cornered, brown towards the base, clothed with soft, spreading, somewhat recurved hairs (see fig. 7). *Leaves* opposite, on very short petioles, spreading, broadly egg-shaped, blunt, serrated, the margin slightly recurved, somewhat downy on both surfaces, paler underneath, with prominent hairy nerves, and resinous dots. *Flower-stalks* axillary, solitary or in pairs, opposite, forked, much longer than the adjoining leaves, from 3- to more than 20-flowered, forming a spurious kind of half whorl, with awl-shaped *bracteas* at the base of the partial flower-stalks. *Calyx* somewhat bell-shaped, not swelling in front, slightly 2-lipped, the outside clothed with long hairs, and minute, shining, resinous glands; the inside smooth, except the throat, which is closed with long, white, projecting, bristly hairs, which are very conspicuous, especially after the flowers have fallen; two lower teeth rather longer and narrower than the three upper (see fig. 6). *Corolla* pale purplish-blue, about twice as long as the calyx, downy; the middle lobe of the lower lip with a broad shallow notch; throat with white club-shaped bristles. *Seeds* pale brown, minutely dotted.

The whole herb has a strong aromatic smell, resembling that of Pennyroyal, and is said to make an agreeable tea, of somewhat tonic effect. It is distinguished from *Calamintha officinalis* by the prominent hairs of the calyx.

*Elatine hexandra.* Six-stamened Water-wort. ♂

Mathews Del & Sc.

Pubd by W. Baster Botanic Garden Oxford. 1812.

## ELATINE\*.

*Linnean Class and Order.* OCTA'NDRIA†, TETRAGY'NIA.

*Natural Order.* CARYOPHY'LLEÆ‡, Linn.—Juss. Gen. Pl. p. 299.—Sm. Gram. of Bot. p. 159.—Lindl. Syn. p. 43.; Introd. to Nat. Syst. of Bot. p. 156.—Rich. by Macgilliv. p. 507.—Loud. Hort. Brit. p. 501.—Don's Gen. Syst. of Gard. and Bot. v. i. p. 379.—Mack. Fl. Hib. p. 40.—Hook. Brit. Fl. (4th ed.) p. 400.—ROSALES; subord. RHœADOSÆ; sect. DIANTHINÆ; type. ELATINACEÆ; Burn. Outl. of Bot. pp. 614, 784, 805, & 806.

**GEN. CHAR.** *Calyx* (fig. 1.) inferior, of 3 or 4, roundish, slightly concave, rather unequal, spreading segments, permanent. *Corolla* (see fig. 2.) of 3 or 4, egg-shaped, blunt, sessile, spreading petals, alternate with the segments of the calyx. *Filaments* (see figs. 2 and 3.) 6 or 8, awl-shaped, about as long as the petals. *Anthers* roundish. *Germen* (see figs. 3 & 4) superior, large, globular, rather depressed. *Styles* (see figs. 2 to 4.) 3 or 4, upright, very short. *Stigmas* simple. *Capsule* (fig. 5.) globose, depressed, large, of 3 or 4 valves, and 3 or 4 cells. *Partitions (dissepiments)* alternate with the valves (see fig. 6), attached only to the *central column (placenta)*. *Seeds* (figs. 7 & 8.) numerous, upright, oblong, curved, furrowed and transversely striated, attached to the central, free *placenta*.

The 3- or 4-parted *calyx*; the *corolla* of 3 or 4 petals, with from 6 to 8 stamens, and 3 or 4 *styles*; the 3- or 4-valved, 3- or 4-celled, many-seeded *capsule*; and the cylindrical, furrowed, transversely striated *seed*; will distinguish this from other genera in the same class and order.

Two species British.

**ELATINE HEXA'NDRA.** Six-stamened Water-wort. Small Water-wort.

**SPEC. CHAR.** Leaves opposite, in pairs; spathulate. Flowers alternate, stalked, upright, with 6 stamens, and 3 petals. Capsule turbinate, concave at the summit, 3-celled. Seeds about 12 in each cell, nearly straight, ascending.

**LOCALITIES.**—On the margins of ponds and ditches; rare.—*Berks*; Near Binfield: Mr. T. F. FORSTER.—*Leicestersh.* Pond near Whitwick: Rev. A. BLOXAM.—*Shropsh.* About the eastern shore of Bomere Pool, near Condover: Rev. E. WILLIAMS. Mere, at Ellesmere: Rev. A. BLOXAM. Ellesmere Mere between the House of Industry and Otley Park: J. E. BOWMAN, Esq.—*Surrey*; Pond at Felbridge: Mr. EDWARD JENNER.—*Sussex*; Maresfield Mill-pond; and Tilgate Ponds near Crawley: W. BORRER, Esq.—*Warwicksh.* Coleshill Pool: Dr. LLOYD.—**WALES.** *Anglesea*; At the east end of Llyn Coron, with *Elatine Hydropiper*: Br. Fl. In the Mill-pond, Llyn Maeleg, with *Subularia aquatica*: N. B. G.—**SCOTLAND.** *Perthsh.* At Loch Ruisky, near Callander: Mr. G. LYON.—**IRELAND.** On the muddy border of Castlewellan Lake, county of Down: Mr. TEMPLETON. Abundant in Enagh Lough, near Derry; and by the side of the river Bann, below Coleraine: Mr. D. MOORE: Fl. Hib.

**Annual.**—Flowers in July, August, and September.

*Root* of numerous long white fibres, proceeding from the base, and lowermost joints of the stem. *Stems* procumbent, 2 or 3 inches long, alternately branched, leafy, striated, smooth, pale and pelucid. *Leaves* opposite, on very short petioles, elliptical, or inversely egg-shaped, more or less blunt, entire, single-ribbed, or obscurely 3-ribbed, scarcely a quarter of an inch long; rough on the upper surface with minute prominent points. *Peduncles* (*flower-stalks*) axillary, solitary, alternate, simple, naked, single-flowered, about as long as the leaves. *Flowers* small. *Calyx* in 3, broad, rounded, fleshy segments. *Corolla* of 3, somewhat inversely egg-shaped, concave, reddish, or pale flesh-coloured petals, longer than the calyx. *Stamens* 6; filaments awl-shaped, incurved, not longer than the petals. *Anthers* at first purplish, afterwards yellow. *Styles* 3. *Capsule* of 3 cells, and 3 valves. *Seeds* oblong, blunt, very slightly curved, and most beautifully ribbed, and transversely striated.

This is a curious little plant, having the general appearance of *Montia fontana*, t. 196. It is of rare occurrence, and was first observed wild in Britain, in 1798, by the Rev. Mr. WILLIAMS.

For the specimen from which the drawing for the accompanying plate was made, I am indebted to the kindness of Mr. EDWARD JENNER, of Lewes, Sussex, who sent it to me from its locality in Maresfield Mill-pond, Sussex, August 14, 1842.

*Elatine Hydropiper*, Engl. Bot. t. 2670, differs from this species in the greater number of the parts of its fructification, in the strap-shaped, longer, segments of its calyx, and in its seeds being very much curved, not almost straight.

---

“ The world is a glasse wherein we may comtemplate the eternall power and majestie of GOD: it is that great booke of so large a character, that a man may run and read it; yea, even the simplest man that cannot read, may yet spell out of this booke that there is a GOD. Every shepheard hath this Calendar, and every ploughman this A. B. C.”

Phyt. t. 34. f. 1.—*Gramen triticum palustre humilis, spicā breviore*, Moris. v. iii. p. 177. sect. 8. t. 1. f. 6.

LOCALITIES.—In bogs, barren sandy pastures, and on heaths, both in dry and moist situations; frequent.

Perennial.—Flowers in July and August.

*Root* slightly creeping, fibrous. *Culms* from 4 to 18 inches long, decumbent, except when in flower, harsh, rigid, jointed, leafy, striated, and smooth. *Leaves* strap-shaped, taper-pointed, striated, rather glaucous, smooth, except towards the point, where the rib and edges are very rough. *Sheaths* long, striated, hairy especially near the top, entirely divided. *Ligula (stipula)* a tuft of hairs (see fig. 9). *Panicle* very simple, its branches angular, wavy and roughish. *Spikelets* few, turgid, of a violet tinge, containing about 4 florets. *Calyx-glumes* spear-shaped, equal, with a roughish keel. The *Corolla* (see fig. 3.) has two or more dense tufts of shining bristles at its base, with two intermediate depressions. *Outer Palea* with three teeth at the apex, the middle one shortest.

MR. SINCLAIR says, that this Grass appears to be but little susceptible of improvement by being transplanted to a richer soil; that it never appeared to be cropped by the Deer in the Park at Woburn; and that it is late in the production of foliage in the Spring, and produces little after-grass, and is not, therefore, to be recommended for cultivation.

---

The *Natural Order GRAMINÆ* is composed of glumaceous monocotyledonous plants, with cylindrical, fistular stems (*culms*), closed at the joints, and covered with a coat of silex. Their leaves are alternate, one at each joint, with a sheath slit longitudinally on one side, having a membranous appendage (*ligula*) at its summit. Their flowers are small, and are disposed in spikes, panicles, or racemes, which are more or less branched; they are usually perfect, but sometimes monoeious or polygamous, and consist of imbricated bracteas, of which the most exterior are called *glumes (calyx)*, Linn. (fig. 1.), the interior immediately enclosing the stamens *Paleæ (corolla)*, Linn. (fig. 2.), and the innermost at the base of the ovary scales (*nectary*), Linn. (fig. 5.). The *glumes* are usually 2 in number, and alternate; sometimes single, most commonly unequal, and enclose 1 or many *florets* (see fig. 2.). The *florets* (fig. 3.) consist of 2 alternate *paleæ*, the lower or exterior one simple, the upper or interior one composed of 2 united by their contiguous margins, and usually with two keels. The *nectary*, when present, consists of 2 scales (see fig. 5.), which are collateral, alternate with the paleæ, and next the lower of them; either distinct or united. The *stamens* are hypogynous (situated below the germin). The *anthers* are versatile; the *ovary* is single; with 2, very rarely 1 or 3, *styles*; and feathery or hairy *stigmas*. The *pericarp* usually forms one body with the seed; and the *embryo* is lateral, on one side at the base of the farinaceous *albumen*. See Lindl. *Syn.* and Hook. *Brit. Fl.*, 4th edit.

This family is one of the most natural in the vegetable kingdom, and also one of the highest importance to mankind, as it is composed of the true Grasses; among which are *wheat, rye, oats, barley, maize, panick, rice, millet, &c.* It is exemplified in the following plates of this work; viz.—t. 45—56—59—64—68—99—104—108—112—116—144—148—184—192—200—203—208—211—216—247—252—256—288—292—300—324—332—344—348—372—408—412—416—444—448—462—476—480—488—492—496.

## MYRI'CA \*.

*Linnean Class and Order DICE'RIA†,, TETRAN'DRIA.*

*Natural Order.* MYRI'CEAE, Rich.—Lindl. Syn. p. 242.; Intr. to Nat. Syst. of Bot. p. 100.—Rich. by Macgilliv. p. 543.—Mack. Fl. Hibern. p. 257.—Hook. Brit. Fl. (4th ed.) p. 420.—MYRICA'-CEAE, Lindl. Key, p. 57.—Loud. Ency. of Tr. and Sh. p. 934.—CASUARINEAE, Mirbel. in Ann. Mus. v. xvi. p. 451.—R. Brown, in Flinder's Voy. v. ii. p. 571.—AMENTACEAE, Linn.—Juss. Gen. Pl. p. 407.—Loud. Hort. Brit. p. 534 & 535.

**GEN. CHAR.** *Diæcious, occasionally monæcious. Sterile Flowers* in cylindrical sessile catkins (see fig. 1, & a.), loosely imbricated in every direction. *Calyx* (see fig. 2.) a single, egg-shaped, blun-  
ish, concave scale (*bractea* LOUD.) to each floret, longer than the stamens. *Corolla* none. *Filaments* (see fig. 2.) 4, rarely more, short, hair-like, upright, *Anthers* (see figs. 2 & 3.) vertical, large, of 2 divided lobes.—*Fertile Flowers* in egg-shaped, sessile catkins, closely imbricated (see fig. 4, & b). *Calyx* (see fig. 5.) nearly as in the sterile flowers. *Corolla* none. *Germen* (see fig. 6.) egg-shaped, flattish, superior. *Styles* (see figs. 5 & 6.) 2, thread-shaped, spreading, longer than the calyx (bractea). *Stigma* simple, pointed. *Berry* (*Drupe*, LINDL.) (see figs. 8 & 9.) various in substance, of 1 cell. *Seed* (fig. 10.) solitary, upright.

The egg-shaped, sessile catkins, with concave scales; the sterile flowers with from 4 to 6 stamens, with 4-valved anthers; and the fertile flowers with 2 styles, and a 1-celled, 1-seeded berry; will distinguish this from other genera, without a corolla, in the same class and order.

One species British.

MYRI'CA GA'LE. Sweet Gale. Candleberry Myrtle. Dutch Myrtle. Sweet Willow. Gaule.

**SPEC. CHAR.** Stem shrubby. Leaves spear-shaped, broader upwards, distantly serrated in the upper part. Scales of the catkin pointed.

† See folio 143.

**LOCALITIES.**—In bogs and marshes, especially on a gravelly soil.—*Berks*; Golden Gully, near Newbury: Mr. BICHENO, in MAJOR'S *Agr. of Berks*.—*Cambridgesh*. Isle of Ely: Rev. R. REILHAN.—*Cheshire*; Near Whitchurch, so plentifully, that the place where it grows is called *Gale Moor*: Mr. VERNON, in Blackst. Sp. Bot.—*Cornwall*; Marsh, Gulval, and Ludgvan; Dr. FORBES. At Swan Pool, near Falmouth; and near St. Just: Rev. J. P. JONES, in Bot. Tour.—*Cumberland*; Common about the Lakes: N. J. WINCH, Esq.—*Devon*; Bovey Heathfield, near the Coal Pits; Ilsington; Manaton; Ashburton; Holme, &c.: Fl. Devon.—*Dorset*; About Wareham: RAY.—*Essex*; Found near Mr. Warner's Gravel-pit Pond, at Woodford Row, Woodford: MR. R. WARNER; 1771.—*Hants*; Near Rufus's Monument in the New Forest: WITHERING. In a bog above a large pond about a mile beyond Itchen Ferry from Southampton: Mr. E. JENNER.—*Kent*; On Willsborough Lees, near Ashford, plentifully: E. JACOB, Esq.; 1777.—*Lancashire*; Halsall Moss; Woolton Moss; and Chat Moss: G. CROSPFIELD, Esq.—*Lincolns*. In the Fens: MERRETT; 1666.—*Middlesex*; On Hounslow Heath: *ibid*.—*Norfolk*; Dorsingham Moor: MARTYN.—*Northumb*. On moors near Harbottle Castle; and by Roadley Lake; on the South side of Tyne opposite Hepple; between Woodhall and Harbottle; and on the banks of Kimmer Lake near Ellingham: Fl. of Northumb. and Durham.—*Shropsh*. In Moreton Moors, three miles from Blymhill: Rev. S. DICKENSON. Moss at Walford and Yestalls, near Walford; Marbury Bog; Bogs near Ellesmere; about Lee, near Ellesmere; and at Twyford Vownog near Westfelton, in great abundance: Fl. Shropsh.—*Surrey*; Plentiful in a bog by Caesar's Camp near Farnham: Mr. W. W. REEVES.—*Sussex*; On Waterdown Forest, abundant by the bridge on the road from Tunbridge Wells to Bellsewe Green, and on each side of the stream as low down as Benhill Water Mill: Mr. E. JENNMR. At Beckley: Mr. W. W. REEVES.—*Westmoreland*; Common about the Lakes: N. J. WINCH, Esq.—*Yorksh*. Askham Bogs and Langwith, near York; covering many acres at Lowland; Anstwick Moss; and Newton Dale, near Pickering: MR. BAINES, in Yorksh. Fl.—Not uncommon in WALES.—Abundant in bogs and moorish ground in SCOTLAND and IRELAND.

#### A Shrub.—Flowers in May.

*Stems* upright, bushy, 3 or 4 feet high, much branched: *branches* alternate, slender, pubescent, rust-coloured, and sprinkled with white dots. *Leaves* alternate, on short petioles, inversely egg-spear-shaped, pointed; entire and tapering towards the base, distantly serrated in the upper part, about an inch and a half long, deciduous, dark green on the upper surface, paler underneath, smooth, but covered with resinous dots, which emit a delightful fragrance when bruised. *Catkins* numerous, sessile, lateral, and terminal, formed during Summer in the axils of the leaves, and remaining through the Winter, expand the following Spring, before the leaves. *Scales* of the sterile catkins of a red shining brown; the lower ones of the fertile catkins hairy towards the tip. *Berries* very small, covered with resinous dots, rather globose, angular, taper-pointed, with 3 shallow clefts, a small tooth being fixed to each (see fig. 8). Though the sterile and fertile flowers are generally produced on different plants, they are sometimes found on the same plant.—The specimen from which the drawing for the accompanying plate was made, was kindly communicated to me by my much-esteemed friend Mr. E. JENNER, of Lewes, Sussex, from whom I received a great number of specimens of the same plant, and all, like the one figured, monoecious.

---

The **MYRICEÆ** are monoecious or dioecious, amentaceous shrubs with resinous glands and dots, alternate, simple, leaves, and apetalous flowers. The sterile flowers have from 1 to 8 stamens; with 2- or 4-cell'd anthers, opening lengthwise—Their fertile flowers have a 1-celled ovary, surrounded by hypogynous persistent scales. Their fruit is drupaceous, often covered with waxy secretions, or dry. The seed is solitary, and erect; and the embryo is without albumen.

Icon. v. ii. p. 25, with a figure.

LOCALITIES.—In hedges and woods; and by road-sides, and sides of wet ditches, rivers, canals, &c.; frequent.

Biennial.—Flowers in July and August.

*Root* simple, with large fibres. *Stem* upright, from 3 to 6 feet high, branched, cylindrical, polished, striated, leafy, hollow, prickly, prickles near the base but few, near the heads very numerous, long, and sharp. *Root-leaves* (of the first year's plant) egg-oblong, bluish, spread on the ground in a circular form, notched, wrinkled, and rough with prickles thinly scattered over the leaf; *stem-leaves* opposite, sessile, connate at the base, especially the lower ones, strap-spear-shaped, occasionally waved or toothed, smooth, with a strong midrib, which is furnished with distant hooked prickles on the under side. *Heads of Flowers* numerous, oblong-egg-shaped, terminating the stem and branches; on strongly ribbed and furrowed stalks, their ribs set with strong, projecting prickles. *Involucrum* of many leaves, outer ones longer than the head of flowers, inner ones shorter, all curved upwards, their margins and mid-ribs prickly. *Corolla* light purple or lilac, 4-cleft, those about the middle of the head opening first. *Scales* of the receptacle (*bracteas*) (see fig. 6.) as long as the stamens, rigid, bearded, hollow and somewhat triangular at bottom; straight and taper pointed at the summit.

This species is a native of most parts of Europe; also of Siberia; it affords a good example of what is termed a *connate leaf* (*folium connatum*). The leaves are opposite, and so united at the base as to form a kind of cup, in which the rains collect, so that the stem is completely surrounded by water at the places from which the leaves arise. The water thus collected is said to cure warts on the hands, if several times washed with it, and to serve as a beauty wash for the face; hence RAY conjectures that this plant might have received its name of *Labrum Veneris*. It is also supposed to be good for the eyes. "In desert countries," says an ingenious author, "the weary and severed traveller would often exchange the whole of his property for the luxury of a draught from one of these water-lodging plants; but in this country the moisture is of more use to the plant itself than to the passenger or to the possessor."—"Indeed," observes Dr. WITHERING, "this curious structure would appear, in the present instance, to be rather destructive than preservative of animal life, for in the basins formed by these connate leaves, many insects are drowned; so that *Dipsacus* may rank among the vegetable *Muscicapæ*."—Mr. FRANCIS, in his *Little English Flora*, says, that the old receptacles are called by the country children of Essex, and other places, Barber's Brushes, and they form, when the seeds have fallen out, if not a good-shaped, at least a very penetrating hair brush.—Cattle in general, even the Ass, appear to avoid this plant; and its dried stems usually remain through the Winter.

Hibern. p. 116.—*Angelica sylvestris major*, Bauh. Pin. p. 155.—*Angelica palustris*, Riv. Pentap. Irr. t. 17.—*Water Angelica*, Pet. H. Brit. t. 24. f. 10.—*Imperatoria sylvestris*, Decand. Fl. Fr. v. iv. p. 286.

LOCALITIES.—Moist woods, marshy places, and along the banks of rivers and wet ditches; frequent.

Perennial.—Flowers in July and August.

*Root* thick, tapering, branched, and fibrous. *Stem* upright, from 3 to 5 feet high, branched, leafy, hollow, cylindrical, striated, smooth, polished, often purplish, covered upwards with a fine glaucous pubescence which easily rubs off. *Leaves* alternate, large, compound, twice- or thrice-pinnate, a little glaucous; *leaflets* egg-shaped or egg-spear-shaped, pointed, unequally and sharply serrated, never decurrent at the base. *Petioles* (*leaf-stalks*) channelled on the upper surface, those of the stem-leaves especially very much dilated and tumid at the base; somewhat membranous, and many-ribbed. *Umbels* large, convex, with numerous, downy, *general* and *partial rays*. *Universal Involucrum* none, or of 1 or 2 small slender leaves; *partial Involucrum* of many similar leaves, but smaller. *Flowers* numerous, small, white, or more generally flesh-coloured. *Petals* nearly equal, somewhat egg-shaped, pointed, their points uprightish. *Fruit* roundish, small, the channels with single *vittæ*.

This is a large, handsome, herbaceous plant; native of Europe, Siberia, and Caucasus. It is warm, acrid, bitter, and aromatic; but the cultivated kind (*Angelica Archangelica*) possessing those properties in a higher degree, this has been long neglected. The caterpillar of the swallow-tailed Butterfly (*Papilio Machaon*, Shaw's Nat. Misc. v. xi. t. 398.) is said to feed upon it. Cows, goats, and swine eat it; horses refuse it. It renders hay ungrateful to cattle. The herb is said to dye a good yellow. A species of *Erysiphe* is frequent on the living leaves of this species in the Summer and Autumn, about Oxford; and on the dead stems, in the Winter and Spring months, may be found the following parasitic fungi—*Sphaeria Dolilum*, Pers.; *Sphaeria herbarum*, Pers.; and *Phacidium Patella*, Tode. The latter is a beautiful species, and is not uncommon in a perfectly developed state in Bagley Wood, near Oxford. My specimens were collected in May, on dead stems that had remained through the preceding Winter.

The other British species of Angelica, *Angelica Archangelica*, (*Archangelica officinalis*, of HOFFMANN, DECANDOLLE, and LINDLEY,) is distinguished from this by its much larger size, its lobed terminal leaflet, and especially by its seed being free and covered all over with numerous *vittæ*.

## AGRO'STIS \*.

*Linnean Class and Order.* TRIA'NDRIA †, DIGY'NIA.

*Natural Order.* GRAMI'NEÆ, Juss. Gen. Pl. p. 28.—Sm. Gram. of Bot. p. 86.; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293.; Introd. to Nat. Syst. of Bot. p. 292.—Rich. by Macgilliv. p. 393.—Loud. Hort. Brit. p. 542.—Mack. Fl. Hibern. p. 294.—Hook. Brit. Fl. (4th edit.) p. 426.—GRAMINA, Linn.—GRAMINALES; sect. FESTUCINÆ; type, AGROSTIDACEÆ; Burn Outl. of Bot. v. i. pp. 359, and 371.

**GEN. CHAR.** Inflorescence panicled. Panicle loose. Spikelets (fig. 1.) single-flowered. Calyx (see fig. 1.) of 2 rather unequal, pointed, keeled, folded, clasping, awnless, permanent glumes, longer than the corolla. Corolla (see fig. 2.) of 2 unequal, membranous, ribbed paleæ, unchanged after flowering, with a tuft or two of hairs at the base; the larger palea bearing, constantly in some species, a rough, dorsal awn, which in others is most generally wanting; the smaller palea constantly awnless, more membranous, various in size, and occasionally wanting. Nectary of 2 minute scales, sometimes combined. Filaments (see figs. 1 & 2.) 3, hair-like, longer than the glumes. Anthers deeply divided at each end. Germen (see figs. 2 & 3.) egg-shaped. Styles (see figs. 2 & 3.) 2, short. Stigmas densely feathery. Seed (fig. 4.) egg-shaped, polished, loose, wrapped in the unaltered corolla.

The loose panicle; the single-flowered spikelets; the calyx of 2 rather unequal glumes, longer than the corolla; the corolla of 2 unequal, membranous paleæ, the inner sometimes wanting, the outer with or without an awn; and the loose seed; will distinguish this from other genera in the same class and order.

Five species British.

AGRO'STIS ALBA. White Bent-grass. Marsh Bent-grass. White Squitch. Squitch.

**SPEC. CHAR.** Branches of the panicle hispid; branchlets spreading. Calyx-glumes spear-shaped, bristly at the keel. Stem spreading, creeping. Stipula (ligula) oblong, ribbed (see fig. 6).

*folia*, Sincl. Hort. Gram. Wob. p. 347; also *aristata*, p. 345.—*Vilfa alba*, Gray's Nat. Arr. v. ii p. 145.—*Gramen miliaceum majus, paniculâ spadiceâ*, n. 11; and also *paniculi viridi*, n. 12. Dill. in Ray's Syn. p. 404.

LOCALITIES.—In moist meadows and fields; common.

Perennial.—Flowers in July and August.

*Root* fibrous. *Culms* (*stems*) 2 or 3 feet long, decumbent, more or less branched, smooth, striated, leafy, sending out roots from the lower joints. *Leaves* flat, broad, taper-pointed, ribbed, very rough, especially at the edges. *Sheaths* long, striated, smooth, occasionally rough, entirely divided. *Stipula* (*ligula*) oblong, blunt, torn. *Panicle* from 2 to 6 inches, or more, long, rather contracted, especially before flowering, its *branches* spreading, unequal, waved, rough, pale green or purplish. *Calyx-glumes* nearly equal, spear-shaped, smooth, except on the keel. *Corolla* of 2 unequal, pale, thin, membranous *paleæ*, the *anther* of which is largest, and has 5 nerves, and as many teeth; the *inner* is smaller, and only faintly 2- or 3-nerved at the base, with a blunt, nearly entire point. *Styles* very short, *Stigmas* thick and feathery.

When the *culms* become more extensively creeping, and the branches of the *panicle* densely tufted, it is then the *Agrostis stolonifera* of LINNÆUS, and also of Engl. Bot. t. 1532; Mart. Fl. Rust. t. 120; Knapp's Gram. Brit. t. 27. and t. 116.; and Loudon's Encyclopædia of Agriculture, p. 892. par. 5687. It is also the *Agrostis alba* of Leers' Fl. Herborn. p. 21. t. 4. f. 5.; and the *Gramen caninum supinum*, or *Upright Dog's-grass*, of JOHNSON'S edition of GERARDE'S Herbal, p. 26. f. 1.

This variety of *Agrostis alba* is considered to be the same with the *Fiorin-grass* of Dr. RICHARDSON, and the Irish Agriculturists, but it has never been cultivated to any extent in this country, though in Ireland its produce, on moist peat soils, and bogs, is said to be very great. Dr. RICHARDSON, who first brought this grass into notice, (in 1809,) considered it to be superior to all other grasses, and wrote several pamphlets to recommend its cultivation. In those pamphlets many experiments are detailed, tending to prove that *Fiorin-grass* produces hay preferred by cattle to all other, and near treble the quantity afforded by any other grass; that this enormous produce is not the exhausting effect of a single year, but the regular crop to be expected; that this succulent grass is equally serviceable for Winter green food; that it is, in a great degree, indifferent to the extremes of wet or draught, and perfectly insensible to the severities of cold; and that its universality of growth is most remarkable. It abounds in morasses and moors where other grasses cannot contend with it, on thin dry soil as well as wet, extending up the bleakest mountains of our harsh climates, and therefore appears particularly suitable to unproductive, extensive tracts. (See WITHERING'S Arrangement of Brit. Plants, 7th edit. v. ii. p. 158). On dry soils this grass is said to be worth nothing. Tea has been made from *fiorin*, and found useful in rearing calves, being mixed with oatmeal and skimmed milk.

Much information relating to this Grass may be found in the "Letters and Papers of the Bath and West of England Agricultural Society," v. xiii p. 1—53; CURTIS's "Observations on the British Grasses, 5th ed. p. 91—98; DUTTON's "Agricultural Survey of the County of Galway," p. 128—134; and LOUDON's "Encyclopædia of Agriculture," p. 892.

**LOCALITIES.**—In hedges; very rare.—*Cheshire*; In all the hedges about Minshull: Mr. DU BOIS, in *Ray's Syn.*—*Devon*; In a hedge on the right-hand side of the Biddeford road, near the Marsh, about six miles and a half from Barnstaple: **POLWHELE**. In an exposed hedge, parting a furze brake, at Leawood, the seat of C. P. HAMLYN, Esq., in the parish of Bridstow; the seeds may have been originally conveyed there by birds: *Fl. Devon*.—**Kent**; In a wood upon Broadmead near the road to the Cherry Garden: Rev. G. E. SMITH.—*Surrey*; In its wild, thorny state, in a hedge near the top of Redstone Hill, left-hand of the Nutfield road, where I have observed it for many years: Mr. LUXFORD, in *Reig. Fl. Sussex*; About Ashburnham, truly wild; Rev. J. DAVIES. Hedges in two places at Henfield, and one in Hurstpier-point: N.B.G. Two or three trees, apparently wild, in Ore Lane, Hastings, on the right, just before coming to the descent near Dr. FEARON'S house; woods at the Old Road, Hastings; hedges at the back of St. Leonard's, between Catfield and Ninfield: Dr. W. A. BROMFIELD, in N. B. G.—*Worcestersh.* In a coppice bordering Deerhurst Lane, opposite the Lower Lodge, near Tewkesbury, a spot almost overgrown with underwood, the lane being merely a rough horse-track: Mr. E. LEES.

### Tree.—Flowers in May and June.

A small or middle-sized branching tree. *Branches* spreading; thorny in a wild state, covered with an ash-coloured bark. *Leaves* deciduous, alternate, spreading, on short petioles, oblong-spear-shaped, wavy, generally entire, single-ribbed, 4 or 5 inches long, mostly downy beneath; assuming a handsome stellate form of growth. *Flowers* (see fig. 2.) solitary, at the summit of each branch, on short downy peduncles (flower-stalks), large, with white, undulated *petals*, scentless. *Calyx* (see fig. 1, a.) with long, narrow, downy, permanent segments (see fig. 3). *Styles* (see fig. 1, c.) 5, club-shaped, encompassed at the base with an elevated ring arising from the *floral receptacle*. *Fruit* (fig. 3.) depressed, concave at the top, fleshy; reddish-brown, somewhat hairy, containing 5 gibbous, wrinkled, 1-celled stones, in each of which are 2 *seeds*, but one is usually abortive; pulp thick, mixed with callose granules (see fig. 4).

This is a tree of very unequal, often humble and deformed, growth. It is a native of Europe and Siberia, in woods and among bushes, and in a wild state it is furnished with shining thorns, which disappear by culture. Several varieties are cultivated in gardens for the sake of the fruit, which, when firm and sound, is of a singularly austere disagreeable taste; but having lain some time after being gathered, till it assumes a state of decay, and becomes soft, it acquires a flavour extremely agreeable to many, though to others altogether unpalatable. *Medlars* should be gathered towards the end of October, or the beginning of November, when some should be laid in moist bran, (in several layers,) to forward their decay; others on straw in the fruiter; those in the bran will begin to be ready for use in about a fortnight, and those laid on straw will come gradually forward in succession.—*Encyclop. Brit.*

I have, some seasons, observed *Æcidium laceratum* (a parasitic fungus) to be very abundant on the leaves of the Medlar-tree in the vicinity of Oxford.

The drawing for the accompanying plate was made from garden specimens, for which I am indebted to Mr. B. ROBINSON; and Mr. QUARTERMAN, Gardener, at the Radcliffe Observatory. The fruit of the wild variety is described as being small, dry, and worthless.

COLLINS, in N. B. G.—*Suffolk*; On the sea-coast of the county: *Gough's Camden*.—WALES. *Anglesea*; On sea rocks, particularly S. W. coast; Llanddwyn, &c., rarely attainable without climbing. Rev. H. DAVIES. Rocks on the S. W. coast, between Aberffraw and Holyhead: J. E. BOWMAN, in N. B. G.—*Glamorgansh*. Plentiful about Port Eynon: Dr. TURTON. Less plentiful in several places between Port Eynon and Swansea: L. W. DILLWYN, Esq.—*Pembrokesh*. In the rocks W. from St. Gowen's: Mr. MILNE.—SCOTLAND. *Kirkcudbrightsh*. Arbigland, in the county of Galloway: Dr. BURGESS.—*Wigtownsh*. At West Tarbet, and near the point of Mull, on the W. side: G. MACNAB, in N. B. G. Mull-Head of Galloway, with *Inula dysenterica*: Mr. MAUGHAN.—IRELAND. Sea-shore on the south side of the Hill of Howth, in muddy places; on steep banks, and in crevices of rocks, below the Rev. Dr. MAC DONNELL's cottage, on the S. side of Killiney Hill, and on Lambay Island, abundant: *Fl. Hibern*.—Near Coolum in the county of Waterford: COUNTESS of CARRICK, 1837.

### Perennial.—Flowers in August and September.

*Root* creeping. *Stem* about a foot high, upright, sometimes decumbent, firm, cylindrical, smooth, striated, leafy, nearly filled with pith, a little branched at the summit. *Leaves* numerous, crowded, sessile, strap-shaped, smooth, very fleshy, generally with three blunt teeth at the end. *Flowers* few, solitary, terminating the stem and upper branches, their stalks thick, and clothed with awl-shaped bracteas. *Involucrum* of numerous smooth, flat, awl-shaped, fleshy scales. *Corolla* rather large and showy; *dish* orange-coloured; *rays* spreading, of a golden yellow. *Seeds* woolly. *Pappus* rough.

As well as of Britain this plant is also a native of France, Spain, Portugal, the coasts of the Mediterranean Sea, Barbary, &c., and Arabia; in salt-marshes. It is occasionally gathered and brought to Covent Garden market, under the name of *Golden Samphire*, and is used for the same purposes as the common samphire, (*Crithmum maritimum*, t. 267), but it has none of the warm aromatic taste of that plant.

LOCALITIES.—On highland rocks in Scotland; very rare.—*Forfarshire*; On a rock on one of the mountains at the head of Clova, near the White Water, in great abundance: Mr. G. DON. Rocks on the left side of Glen Dole (towards Glen Phu?), almost facing a person when turning from Glen Clova to Glen Dole: Mr. H. C. WATSON, in N. B. G.

Perennial.—Flowers in July.

Root woody, long, and slender. Stem none. Leaves all radical, pinnate, stalked; leaflets numerous, from 8 to 12 pairs, with an odd terminal one, all uniform, elliptic-spear-shaped, pointed, entire, usually besprinkled with silky shining hairs, but sometimes quite smooth, except the mid-rib. Stipulas large, egg-shaped, pointed, simple, entire, membranous, veiny, hairy at their margins, united in pairs to the base of each petiole. Scape (flower-stalk) hairy, about equal in length to the leaves, ascending, sometimes decumbent, bearing from about 8 to 12 flowers in a close, oblong, or somewhat egg-shaped, spike, or head; each flower accompanied by a spear-shaped, hairy, somewhat membranous bractea at its base (see figs. 1 & 9). Calyx (see fig. 1.) tubular, longer than its accompanying bractea, clothed with dense, close, black as well as white hairs, its teeth short, and sometimes tipped with brown. Corolla (see fig. 2.) cream-coloured, or buff; the keel (fig. 5.) and wings (fig. 4.) tinged with purple. Legume (fig. 8.) somewhat egg-shaped, inflated, with a straight point, covered, like the calyx, with short, spreading, black as well as white hairs.

An elegant little plant, growing from 3 to 6 inches high. It is a native of Europe, on the Alps, but was not known as a native of Britain until Mr. G. DON discovered it, in the Summer of 1812, in great abundance, in the locality recorded above.

The Natural Order LEGUMINOSÆ is composed of dicotyledonous trees, shrubs, or herbaceous plants. Their leaves are alternate, mostly compound and pinnated, with a pair of stipules at the base of each petiole. The flowers are either axillary or terminal, and are disposed in racemes or panicles, rarely solitary. The calyx is inferior, either tubular and 5-toothed, or more or less deeply cut into 5 unequal segments. The corolla consists of 5 petals, or by abortion of only 4, 3, 2, 1, or none, inserted into the base of the calyx, and is either papilionaceous or regularly spreading; the odd petal (fig. 3.) posterior. The stamens (fig. 6.) are various, usually 10, and are either distinct, or monadelphous, or diadelphous. The ovary (fig. 7.) is simple, superior, 1-celled, and 1- or many-seeded. The style is simple and thread-shaped, proceeding from the top of the upper suture of the ovary, and crowned by a terminal or lateral stigma. The legume (figs. 8 & 9.) is usually 2-valved, membranous, coriaceous, rarely fleshy or drupaceous, dehiscent or indehiscent. The seeds are attached to the upper suture of the legume, and are either solitary or several, usually oval, or kidney-shaped, and hang by various shaped funicles (little stalks), which sometimes, though rarely, expand into an arillus; embryo either straight or with the radicle bent upon the cotyledons; albumen none; cotyledons either remaining under ground in germination, or elevated above the ground, and becoming green like leaves.

The British Genera in this order are—*U'lex*, t. 93.—*Genista*, t. 84.—*Spártium* (*Cy'tisus*, Hook.), t. 77.—*Onónis*, t. 289.—*Anthy'llis*, t. 397.—*Medicágo*, t. 329.—*Melilótus*, t. 363.—*Tri-fólium*, t. 283.—*Lótus*, t. 249.—*Oxy'tropis*, t. 495.—*Astrágalus*, t. 453.—*Ornithopus*, t. 358.—*Hippocrépis*, t. 369.—*Onóbrychis*, t. 134.—*Vicia*, t. 173.—*E'rnum*, t. 322.—*Láthyrus*, t. 117.—*Pisum*, t. 225.—*O'robus*, t. 433.

*Elymus europaeus* Wood. Lyme-grass 24

Published by W. Barter Botanist to Her Majesty's S. S.

## E'LYMUS \*.

*Linnean Class and Order.* TRI'NDRIA †, DIGY'NIA.

*Natural Order.* GRAMI'NEÆ ‡, Juss. Gen. Pl. p. 28.—Sm. Gr. of Bot. p. 86.; Engl. Fl. v. i. p. 71.—Lindl. Syn. p. 293.; Introd. to Nat. Syst. of Bot. p. 292.—Loud. Hort. Brit. p. 542.—Mack. Fl. Hibern. p. 294.—Hook. Brit. Fl. (4th ed.) p. 426.—GRAMINA, Linn.—Rich. by Macgilliv. p. 393.—GRAMINALES; sect. TRITICINÆ; type, HORDEACEÆ; Burn. Outl. of Bot. v. i. pp. 359 and 362.

**GEN. CHAR.** Inflorescence spiked; spikes imbricated. *Rachis* (*common receptacle*) many-flowered, continuous, elongated, toothed alternately, at each side, and flattened just above. *Spikelets* (figs. 1 & 2.) 2 or 3 at each tooth of the rachis, parallel, 2- or 3-flowered, all perfect. *Calyx* (see figs. 2 & 3.) of 2 unequal, upright, strap-spear-shaped, or awl-shaped, pointed or awned, more or less keeled glumes, both on one side of the spikelet. *Corolla* (fig. 3.) of 2, unequal, egg-spear-shaped paleæ; the outermost largest, keeled, ribbed, pointed or awned; the awn straight and terminal; inner palea flat, cloven, inflexed at the edges, with a rib at each side. *Nectary* (fig. 5.) of 2 spear-shaped scales. *Filaments* (see fig. 3.) 3, hair-like, shorter than the corolla. *Anthers* strap-shaped, notched at each end. *Germen* (fig. 4.) turbinate. *Styles* (see fig. 4.) 2, distant, very short. *Stigmas* feathery, spreading. *Seed* (figs. 6 & 7.) strap-shaped, or spear-shaped, channelled along the upper side, very hairy at the summit, more or less attached to the unchanged paleæ of the corolla.

The 2- or many-flowered *spikelets*, 2 or 3 together at each tooth of the rachis; and the *calyx* of 2 parallel glumes, 2- or 3-flowered, *all* perfect; will distinguish this from other genera, with a spiked inflorescence, in the same class and order.

Three species British.

E'LYMUS EUROPE'US. European Lyme-grass. Wood Lyme-grass. Wood Barley-grass. Great Wood Rye-grass.

**SPEC. CHAR.** Leaves flat, pliant. Spike upright, compact, smooth. Spikelets ternate, 1- or 2-flowered. Calyx-glumes bristle-like. Florets terminated by a long awn.

In the Eaws at Heptonstall, Stanley Clough, near Todmorden. In a wood by the side of the Huddersfield Canal. In a wood belonging to the Wade House Farm, at Shelf, near Bradford; Old Park Wood, near Sheffield; Thorp Arch Woods; Woods at Castle Howard; Byland, near Coxwold; Hackfall; Hildenley Wood, near Malton: BAINES' FL. of Yorkshire.—*WALES*. Denbighsh. Gain Dingle, under Garreg Wen Rocks: Mr. GRIFFITH. It appears not to have been found either in Scotland, or Ireland.

#### Perennial.—Flowers in June.

Root fibrous, tufted. *Culm (stem)* upright, 2 feet, or more, high, with 4 or 5 joints, simple, cylindrical, striated, smooth, most leafy in the lower part. *Leaves* strap-spear-shaped, many-ribbed, flat, taper-pointed, smooth to appearance, but rough to the touch, especially at the edges. *Sheaths* clothed more or less with deflexed hairs. *Stipula (ligula)* very short, minutely notched. *Spike* narrow, 2 or 3 inches long, simple, upright, close, green; its *rachis* (main stalk) angular, furrowed, rough, and zigzag. *Spikelets* three together at each tooth of the rachis. *Calyx-glumes* awl-shaped, very smooth and even at the base; ribbed, angular, and roughish above; each terminated with a straight rough *awn*, half its own length. *Florets* 2, sometimes only 1, in each calyx, all generally perfect. Outer *palea* of the corolla (fig. 3.) spear-shaped, ribbed, rough, especially in the upper part, terminating in a long straight *awn*; inner *palea* slightly cloven, rough at the marginal ribs. *Germen* (fig. 4.) abortive, downy. *Styles* distant, very short. *Stigmas* slender. *Seed* (figs. 6 & 7.) spear-shaped, with a furrow along the upper side, and a downy point, firmly coated with both *paleæ*. See ENGL. FL.

This species is a native of Germany and Switzerland, as well as of England. It has so much the habit of a *Hordeum*, (see t. 344), that HUDSON, MARTYN, KNAPP, and some other Botanists, united it with that genus; and it appears to be the opinion of Sir W. J. HOOKER, that it would be much more natural to refer it to the genus *Hordeum* than to that of *Elymus*. Dr. STOKES considered it the connecting link between the two genera. In an agricultural point of view it is of no value, it being a coarse grass, like most other species which grow in woods; and like them it is sometimes drawn up to a great height.

† See fol. 37, note †.      † See folio 449, a.

**LOCALITIES** —On limestone rocks in Ireland.—Plentiful in the woods of Mucross and in all the islands in the lower and upper lakes of Killarney, as well as at Glen-gariff, near Bantry, generally among limestone rocks. About most of the mountain lakes in the barony of Bear, certainly indigenous: *Fl. Hibern.*

### Tree.—Flowers from September to December.

A bushy tree, growing to the height of 20 or 30 feet; its main *stem*, and older branches, covered with a reddish-brown *bark*, the outer layers of which come off in thin flakes. Young shoots often red, and rough with glandular hairs. *Leaves* alternate, evergreen, simple, elliptic-spear-shaped, unequally serrated, bright green, veiny, rigid, on hairy *petioles*, without *stipulas*. *Racemes* (*clusters*) panicled, bent downwards, smooth. *Bracteas* oblong, recurved, one at the base of each partial flower-stalk. *Flowers* very elegant, of a greenish, semi-transparent white, with a shade of red, a little hairy within, destitute of scent. *Anthers* (see fig. 5.) scarlet. *Berry* (see fig. 7.) crimson, about the size of a cherry, and covered with hard tubercles, which give it very much the appearance of a Strawberry, but the seeds are internal.

This very beautiful, evergreen tree, is a native of the south of Europe, also of various parts of Asia, and of Africa, about Mount Atlas and Algiers; and it is particularly abundant in Italy, in the woods of the Appennines. Some consider it as a doubtful native of Ireland, and suppose it to have been introduced there; while others are of opinion "that it is truly an aboriginal native of that country." It is one of the greatest ornaments in the months of October and November, that being the season when it is in flower, and the fruit of the former year is ripe, it taking twelve months to come to maturity; so that, as Mr. SALISBURY remarks, this plant exhibits simultaneously, and during the depth of Winter, the singular phenomenon of lively green leaves, beautiful flowers, and brilliant fruit, thus affording a fit emblem of that perpetual Spring which, in original perfection, pervaded the whole earth, when

" Green all the year; and fruits and blossoms blush'd,  
In social sweetness, on the self-same bough."

The amiable authoress of that very elegant and pleasing work, "The Spirit of the Woods," in her description of the *Arbutus*, alludes to the same fact in the following lines:—

" Mark upon this lovely bough  
How in social beauty grow  
Flowers and fruit, a fairy throng,  
Fitting theme for poet's song;  
Sure not brighter wreaths than this  
Graced the famed Hesperides.  
Yet a lovelier sight I know;  
(Ay, then read'st my riddle now)  
'Tis,—when in the social bower  
Wisdom's fruit, and youth's fair flower,  
(Combination rare as sweet)  
On the self-same scion meet."

The fruit is said to have constituted part of the food of mankind in the early ages. That it was not in any esteem among the ancients, we may suppose from its name *Unedo*, which, according to PLINY, is formed from *unum edo*, I eat one; because it is unpalatable, and few people would try a second: nevertheless it is eaten in Italy, and also in Ireland; and in Spain they extract both a sugar and a spirit from it. The leaves may be usefully employed in tanning leather. VIRGIL alludes to the young branches as Winter food for goats, and to its use for making baskets, &c. About Killarney, in Ireland, where this tree is abundant, boxes, chess-men, &c., are made from the wood, and generally purchased by visitors as memorials of the place.

‡ See fol. 400, a.

### Perennial.—Flowers in August.

*Root* of many long, cylindrical, whitish fibres. *Stem* upright, a foot or more high, slightly 4-cornered, smooth; leafy and simple below; panicle above. *Leaves* about the base of the stem, opposite, petiolate, egg-shaped or elliptic, quite entire, nerved, smooth, from 2 to 4 inches long, and 1 to 2 inches broad; those on the upper part of the stem much smaller, opposite, sessile, elliptic-oblong, entire. *Panicle* upright, terminal, of about 12, sometimes more, flowers, on opposite angular stalks (pedicels), with a pair of elliptic-oblong, entire *bracteas* at their base. *Calyx* purplish, in 5 awl-shaped segments. *Corolla* (see fig. 2.) about an inch in diameter, of a greyish-purple colour, deeply 5-cleft, its segments elliptic, sharp-pointed, dotted with black, with greenish *nectaries*, which are bristly on the edges (see fig. 3, a). *Filaments* (see fig. 4.) 5, awl-shaped. *Anthers* versatile. *Germen* (see fig. 4.) egg-shaped, compressed, often abortive. *Styles* very short. *Capsule* surrounded with the permanent calyx and corolla, egg-oblong, tapering at each end, and shortly 2-beaked at the summit with the spreading stigmas. *Seeds* (see figs. 6 & 7.) numerous, roundish, compressed, with a wide membranous margin, rust-coloured, attached to the thickened margins of the valves in a double row.—Whole *herb* quite smooth, and very bitter.

This plant is a native of Germany, Austria, France, Caucasus, and Siberia; but there is some doubt whether it was ever found wild in Britain. Old authors considered it a *Gentiana*, to which it is very nearly allied, but it differs from that genus (see t. 185.) in the peculiar *nectaries*, and also in the disposition of the seeds.

---

### THE WINTER NOSEGAY.

FLOWERS,—fresh flowers,—with your fragrance free,  
Have you come in your queenly robes to me ?  
Me have you sought, from your fair retreat,  
With your greeting lips and your dewy feet,  
And the heavenward glance of your radiant eye,  
Like angel-guests from a purer sky ?

But where did ye hide when the frost came near,  
And your many sisters were pale with fear ?  
Where did ye hide, with a cheek as bright  
As gleam'd amid Eden's vales of light,  
Ere the wiles of the Tempter its bliss had shamed,  
Or the terrible sword o'er its gateway flamed ?

Flowers.—sweet flowers,—with your words of cheer,  
Thanks to the friend who hath brought you here ;  
For this may her blossoms of varied dye,  
Be the earliest born 'neath the vernal sky ;  
And she be led by their whisper'd lore  
To the love of that land where they fade no more.

Mrs. SIGOURNEY.

LOCALITIES.—Sandy sea-shores, principally on the east and south of England, rare.—*Cornwall*; On the gravelly shore between Penzance and St. Michael's Mount: RAY; 1690. I did not observe it there: Mr. H. C. WATSON, in N. B. G.; 1835.—*Devon*; On the Devonshire Coast: Dr. WITHERING.—*Dorset*; Near Pool: HUDSON. On the Burton and Bridport Sands: Rev. PALK WELLAND. Near Burton, by Bridport: Rev. J. LIGHTFOOT.—*Essex*; At Landguard Fort: Mr. T. F. FORSTER, jun.—*Kent*; In the Isle of Sheppey: HUDSON.—*Suffolk*; On the beach just above high-water mark, one mile north of Landguard Fort, 1793; also between Lowestoft and Pakefield, and on other parts of the Suffolk coast: Sir J. E. SMITH. Aldborough, and Orford, near the Light Houses: Rev. G. CRABBE. Beach at Dunwich, plentifully: Mr. DAVY.—*WALES*. *Anglesea*; On the sand near Abermenai Ferry, plentifully: RAY. Now become very scarce below Llanfaelog, where Mr. BREWER "found it in great plenty for a mile together," on Sept. 5, 1727: Rev. H. DAVIES.

Perennial.—Flowers in August and September.

Root woody, branched, descending to a great depth in the sand. Stems from 6 inches to a foot high, recumbent at the base, brittle, cylindrical, very leafy, branched; branches upright, corymbose. Leaves numerous, scattered, somewhat 4-ranked, sessile, oblong, blunt, flat, crenate, withering, permanent, clothed like every other part of the plant, with a dense, white, cottony down. Flowers bright yellow, in terminal corymbose tufts. Involucrum densely woolly, almost concealing the small yellow florets, which are remarkably prolonged down the sides of the germen (see fig. 4.), forming two ear-like appendages, which finally form a border to the seed. Receptacle small, nearly globular, with strap-shaped, chaffy scales, about as long as the involucrum, smooth in the lower part, cottony in the upper.

This plant is a native of the south of Europe, and is said to grow in great plenty on the borders of the Mediterranean sea. Sir J. E. SMITH says, that it is generally taken for the original ancient *Gnaphalium* of DIOSCORIDES, it being frequent on all the shores of the Archipelago; and this opinion is confirmed by TOURNEFORT, in his Voyage into the Levant, English 4to. ed. v. i. p. 21; 8vo. ed. v. i. p. 27. It was this celebrated French Botanist who detected the 2 spurs on the tube of each floret, which form a sort of wings to the seed, a character on which the present genus is founded.

*Cladium Mariscus. Prickly Turf-mart.*

Mullens Del. & Sc. Pubd by W. B. Dyer Botanic Garden Boston 1843.

## CLA'DIUM \*.

*Linnean Class and Order.* DIA'NDRIA †, MONOGYNIA.

*Natural Order.* CYPERA'CEAE †, Juss.—Lindl. Syn. p. 278.; Introd. to Nat. Syst. of Bot. p. 304.—Rich. by Maegilliv. p. 392.—Loud. Hort. Brit. p. 541.—Mack. Fl. Hibern. p. 318.—Hook. Brit. Fl. (4th ed.) p. 427.—CYPEROIDEAE, Juss. Gen. Pl. p. 26.—Sm. Gr. of Bot. p. 68.—CYPERALES; sect. CYPERINAE; type, PAPYRACEAE; Burn. Outl. of Bot. v. i. pp. 354 & 356.—CALAMARAE, Linn.

**GEN. CHAR.** Stems leafy. Inflorescence terminal and axillary, panicle. Spikelets numerous, aggregate, bracteated, 1- or 2-flowered (see fig. 1). Glumes (see fig. 1 to 4.) somewhat 2-ranked, imbricated, concave, sheathing, mostly sterile, one or two of the uppermost only being perfect and single-flowered (see fig. 2). Corolla none. Filaments (see fig. 2.) 2 or 3, strap-shaped, longer than their glume. Anthers strap-shaped, upright. Germen (see fig. 2.) superior, egg-shaped, without any bristles or scales (hypogynous setæ) at the base. Style (see figs. 2 & 5.) thread-shaped, the length of the stamens, deciduous, but without a joint at the bottom. Stigmas 2, 3, or 4, slender, pointed, downy. Fruit (drupa) (fig. 7.) a nut, with a thick fleshy epicarp (external coat), egg-shaped, pointed (see fig. 6). Seeds smooth.

The much-branched panicle; the 1- rarely 2-flowered, aggregate spikelets, with chaffy, sheathing glumes, the lower ones smaller and empty; and the fruit without bristles at the base; will distinguish this from other genera, without a corolla, in the same class and order.

One species British.

**CLA'DIUM MARI'SCUS.** Prickly Twig-rush. Prickly Bog-rush. German Prickle-rush. Long Bastard Cyperus.

**SPEC. CHAR.** Culm round, smooth, leafy. Leaves serrated at the margins and keel with strong, upright, bristly teeth. Panicle much divided, leafy. Spikelets capitate.

DAVIES, and Mr. OWEN GRIFFITH; 1842.—*Glamorgansh.* Cionlyn Bog near Swansea: B. G.—**SCOTLAND.** Forfarshire; formerly found in this county.—*Sutherland*; In large quantity in a marsh by the road-side, about half way between Kyle-triome and Batcall Church: North. Fl.—*Wigtossh.* Plentiful in Galloway: Br. Fl. 5th ed. 1842.—**IRELAND.** By the sides of small lakes in *Cunnamara*, abundant. *County of Fermanagh*; and in a bog near Lough Allan, *County of Cork*: Fl. Hibern.

**Perennial.**--Flowers in July and August.

Root long and creeping. Culms from 3 to 5 feet high, upright, polished, jointed, leafy, angular at the top. Leaves sheathing, very long, strap-shaped, keeled, triangular at the point, their margins and keels strongly serrated, almost prickly. Panicle upright, much divided, leafy; peduncles compressed, flat on the upper sides, rounded beneath, smooth, with sheathing, bristle-shaped bracteas at their base. Spikelets (see fig. 1.) egg-shaped, from 6 to 12 in a dense head. Glumes (see figs. 2, 3, & 4.) numerous, imbricated, brown; inner ones (fig. 2.) the longest, generally the two or sometimes three innermost ones are floriferous, of which one or two bears a coated nut (fig. 6.) almost as large as the spikelet. Stigmas (fig. 5.) usually 2, sometimes cloven, downy.

This plant, which is rare in most parts of England, and still more rare in Scotland, is said to be so plentiful in the Fens of Cambridgeshire, as to cover hundreds of acres, to the total exclusion of all other plants. It serves for thatching instead of straw, and often grows in such quantities in pools, as to form floating islands. It is said to be hurtful to cows.

The drawing for the accompanying plate was made from a specimen gathered in Anglesea, by Mr. OWEN GRIFFITH, in Sept. 1842, and kindly communicated to me by J. SATTERFIELD, Esq.

I have also received specimens of it from Mr. W. WILLIS, of Charlestown near St. Austell, Cornwall.

Lathams Del & Sc. *Lilium Martagon*. Martagon Lily. 2

**LOCALITIES.**—In copses, and on banks among bushes; a doubtful native.—*Essex*; In tolerable plenty near the village of Sampford, on the road from Great Bardfield to Walden, where it was pointed out to Mr. EDWARD DOUBLEDAY, in May, 1841, by Mr. R. M. SMITH, of Great Bardfield, who had known of it for above twenty years. The spot is a high bank, sprinkled with low bushes, on the side of a lane leading from the village eastward to some unexplored part of the county: *The Phytologist*, v. i. p. 62.—*Kent*; At Ash, near Wrotham, where it grows plentifully in a very wild situation on an estate belonging to Mr. GLADDISH: Mr. N. B. WARD, in *The Phytologist*, v. i. p. 76.—*Surrey*; “Communicated” to *English Botany*, “by the Rev. WILLIAM A. BROMFIELD, and Mr. BORRER, from a copse on the grounds of Mr. REID at Woodmanstone, about five miles from Epsom, well known to the inhabitants of the village under the name of Turk’s-cap Shaw. It grows among the thick underwood in great abundance, and is remembered by the older people of the neighbourhood to have flourished truly wild in that locality for more than half a century. Found likewise under similar circumstances in Marden Park near Godstone, and in a wide hedge-row between Headley and Juniper Hall, under Box Hill.” *English Botany, Supp.* folio 2799. See also *Loud. Mag. Nat. Hist.* v. iii. p. 153. and vol. viii. p. 117. In a little coppice to the right of the lane leading from Mickleham to Headley; the coppice was (in 1826) overshadowed by oak trees of considerable size, and the underwood had been cut during the previous year, so that the tall racemes of the Lily stood up nobly and conspicuously above the brushwood, and it would have been difficult for any passing observer not to have noticed them: Mr. E. NEWMAN, in *The Phytol.* p. 26. In the greatest profusion (in 1840) in the station last mentioned. In some parts of the coppice the plants were so crowded, that the flowers produced a perfect blaze of the richest colour among the young trees: *ibid.*—*Yorkshire*; Said to grow in a wood near Kirby Fleetham, to all appearance wild: see *Loud. Mag. Nat. Hist.* v. iii. p. 438.

### Perennial.—Flowers in July.

*Bulb* (fig. 8.) composed of spear-shaped, loose, yellow scales, with thick, long, whitish fibres at the base. *Stem* about 3 feet high, upright, straight, cylindrical, shining, slightly pubescent, pale green at bottom, purplish upwards, with scattered black spots. *Leaves* egg-spear-shaped, quite entire, the upper ones almost strap-shaped; in very regular, distant whorls. *Flowers* terminating the stem in a loose, wide-set panicle; their peduncles purple, spotted with black, with two spear-shaped *bracteas* at their base. *Corolla* pale purple, with dark spots; petals elegantly recurved, the three outer slightly hairy, with a raised line along the middle. *Filaments* and *Style* pale. *Anthers* bay, with orange-coloured pollen.

This very ornamental plant is a native of Germany, France, Siberia, Spain, and Portugal. It appears to have been cultivated in our gardens for nearly three centuries, for GERARDE says, in 1597, that he had had it many years growing in his garden. Its claim to be considered a native of England rests upon the authorities recorded above. A white-flowered variety is sometimes met with in gardens; and also a larger variety with a pubescent stem, figured in the *Bot. Mag.* t. 893. “The bulbs of this and some other species of Lily are cultivated in some parts of the Continent as the potatoe is with us, and furnish a nutritious and agreeable article of vegetable diet.” *Engl. Bot.*

Descending Grasmoor to Crummockwater, rather on the Buttermere than the Seale Hillside: N. B. G.—*Derbysh.* On Kinder-Scout near Hayfield: B. G. Fox House, on the Moors: 1835; N. B. G.—*Durham*; Cronkley Fell; Force Garth Scar, Teesdale Forest; and near Caldron Scout: B. G.—*Lancash.* Four miles from Heptonstall near Widdop, on a great stone by the river Gorlpé: MERRETT, (1666). Shown to RAY, on the same spot, (before 1690), by T. WILLIS: *Ray's Syn.* “There is no such river as Gorlpé, nor is the plant now to be found in Widdop:” Mr. LEYLAND, in N. B. G.—*Northumberland*; On the Heath on the South side of East Common Wood near Hexham; on Acton Cleugh, five miles N. of Blanchland; and on Little Waney-house Crag, sparingly: *Fl. of North. & Durh.*—*Shropsh.* Devil's Arm-chair, Stiperstones Hill: A. AIKEN, Esq. in *Fl. of Shropsh.*—*Westmoreland*; Dale-head, near Ullswater: B. G.—*Yorkshire*; Hutchin Moor, near Todmorden; on Cronkley Scar, and on Falcon Clints Scar, on the opposite side of the Tees above Middleton. It formerly grew in the Eaves at Heptonstall, but is now eradicated: Mr. BAINES, in *Fl. Yorksh.*—*SCOTLAND.* Abundant on dry heathy, rocky places, in the Highlands and Western Isles: HOOKER.—*IRELAND.* Very abundant on the limestone mountains, barony of Burren, county of Clare, and on several mountains in Cunnamara. At Fair-head, county of Antrim: *Fl. Hibern.*

#### Shrub.—Flowers in June.

Root long, branched, and fibrous. Stems numerous, woody, cylindrical, smooth, or slightly pubescent, very long, trailing on the ground, much branched, leafy. Leaves alternate, on short petioles, inversely egg-shaped, blunt, entire, stiff, rigid, evergreen, shining and wrinkled on the upper surface, veiny and paler beneath, smooth, except the slightly revolute margins, which are minutely downy. Scales of the buds spear-shaped, pointed, permanent. *Stipulas* none. Flowers in short, drooping, terminal clusters (*racemes*), with many pointed, coloured *bracteas*. Segments of the *calyx* pale, often fringed. Corolla of a beautiful rose-colour, smooth. Berry globose, depressed, smooth and glossy, red when ripe, about the size of a holly-berry, mealy within, very austere and astringent.

As well as of Britain this plant is also a native of North America, in the pine-barrens of New Jersey, and in mountainous and rocky situations of Canada and New England; and the Island of Unalascha. It is abundant on the continent of Europe, as in Sweden, Denmark, and most parts of the north; also in Switzerland, Germany, Carniola, Dauphiny, Savoy, Siberia, &c.—The whole plant is powerfully astringent; it abounds in the tannin principle; and, both in Sweden and America, it has been used for tanning leather, and dyeing it an ash-grey colour. Half a drachm of the powder of the leaves given every morning, or 2 or 3 times a day, has been found useful in calculus and nephritic complaints, and other disorders of the urinary passages. It was also strongly recommended, by the late Dr. BOURNE, of Oxford, in cases of pulmonary consumption\*. Punsh says, that on the plains of the Mississippi the Indians smoke the leaves under the name of *Sacacommis*, and consider them of great medicinal virtue. Dr. JOHNSTON informs us (*Fl. of Berw.*), that the berries of this Shrub are known by the common people in the west of Berwickshire by the name of *Rapperdandies*, and are eaten by them. They are dry, mealy, and austere, but are said to afford excellent food for grouse and other game.

**LOCALITIES.**—In wet spongy mountain bogs; very rare.—*Shropsh.* Bomere Pool, near Shrewsbury; Aug. 4, 1832: C. C. BABINGTON, Esq. in *Loud. Mag. Nat. Hist.*, v. vi. p. 368. Found in the same locality by the late JOHN JEUDWINE, Esq., M. A. Second Master of Shrewsbury School, seven years previously to Mr. BABINGTON's discovery: MR. LEIGHTON, in *Fl. of Shropsh.* On the moss on the west side of Bomere Pool, and also on the adjoining Shomere moss, both near Shrewsbury: *Fl. of Shropsh.*—*Yorksh.* In Lakeby Car, near Borough-bridge, growing abundantly along with *Lysimachia thyrsiflora*, 1807: (Rev. Mr. DALTON.) Sir J. E. SMITH, in *English Botany*. Mr. BAINES says (1840), that he had diligently examined Lakeby Car, for five seasons, without being able to find a single specimen. See *Fl. of Yorkshire*.—**SCOTLAND.** *Perthshire*: Methven, near Perth: Mr. DUFF, 1833.

### Perennial.—Flowers in May and June.

*Root* long, creeping, tough, with a lax, white and shining cuticle. *Stem* upright, from 5 to 8 inches high, wavy, simple, smooth, compressed. *Leaves* few, upright, 2-ranked, alternate, becoming considerably elongated after flowering, semicylindrical, blunt, with a terminal pore or depression on the upper side (see fig. 6.); spongy within, dilated at the base into a large, membranous, clasping, blunt stipula. *Cluster* (*raceme*) terminal, of about 5 small, inconspicuous, greenish-brown flowers, each on a partial stalk with a membranous, leaf-like *bracteæ* at its base. *Perianth* and *Stamens* (see fig. 1.) reflexed. *Anthers* (see figs. 1 & 2.) brown, vertical, strap-shaped, opening at the inner side by 2 longitudinal parallel fissures. *Germens* (see figs. 1, a.) usually 3, egg-shaped, with lateral, sessile, oblong, downy *stigmas*. *Capsules* (see fig. 3.) globose, about the size of a pea, coriaceous, inflated, wrinkled, each containing 1 or 2 egg-shaped, smooth seeds.

This very curious and interesting little plant is a native of Lapland, Sweden, Denmark, Germany, Switzerland, Prussia, Dauphine, and Siberia. It had never been found wild in Britain until the Rev. JAMES DALTON discovered it, in 1807, growing abundantly in Lakeby Car, near Boroughbridge, as stated above; but where it has now, according to Mr. BAINES' observations, become very rare, if not extinct. A living plant from Bomere Pool, near Shrewsbury, was kindly communicated to me in July, 1838, by W. BORRER, Esq. of Henfield, Sussex.

---

The *plant*, up springing from the *seed*,  
Expands into a perfect *flow'r*;  
The virgin-daughter of the mead,  
Wooed by the sun, the wind, the show'r;  
In loveliness beyond compare,  
It toils not, spins not, knows no care,  
Trained by the secret hand that brings  
All beauty out of waste and rude,  
It blooms a season,—dies,—and flings  
Its *germs* abroad in solitude.

MONTGOMERY.

**LOCALITIES.**—In fields, waste places, and dunghills; not really wild.—*Cambridgesh.* In the corn-field by the road to Hintou, between Cambridge and the New Mill: Rev. R. RELHAN.—*Durham*; On the Ballast-hills of Tyne and Wear; and near Marley Hill; a naturalized exotic: N. J. WINCH, Esq.—*Essex*; About Coggeshall, Tolesbury, and other places: RAV. Under the Cliff, below South End: Mr. E. FORSTER, jun.—*Lincolnsh.* Wild and uncultivated places about Folkingham, very plentiful, and apparently indigenous: L. W. DILLWYN, Esq.—*Northumberland*; On the Ballast-hills of Tyne: N. J. WINCH, Esq.—*Suffolk*; About Ipswich: Sir J. E. SMITH. Among corn near Framlingham: CRABBE.—*Surrey*; Lane between Dorking and Ranmore Common: N. J. WINCH, Esq. Battersea Fields: FL. METR.—In *Worcestershire*: Mr. E. LEES, in N. B. G.—*SCOTLAND*. Aberdeensh. On the Inch, opposite the dock-yards, near Aberdeen: G. DICKIE, Esq.—*Lanarksh.* Banks of the Canal, Possil, near Glasgow: Mr. W. CHRISTY, in N. B. G.

#### Annual.—Flowers in June.

*Root* small, tapering. *Stem* upright, from a foot, or a foot and a half, to 2 feet high, more or less branched, leafy, cylindrical, striated, smooth. *Leaves* compound, various; lower ones either simply or doubly pinnate, with the leaflets wedge-shaped, or fan-shaped, and sharply notched; upper leaves gradually more compound, with the segments very narrow and strap-shaped, those of the uppermost leaves almost bristle-shaped. *Umbels* lateral and terminal, stalked, of 4 or 5 *general rays*, rarely more; the *partial rays* more numerous. *Universal Involucrum* usually wanting, but sometimes of 1 or 2 small narrow leaves; *partial one* of about 3 strap-spear-shaped leaves, all directed to one side. *Calyx* more distinctly formed than is usual in umbelliferous plants. *Flowers* white, sometimes tinged with red; *petals* of the *outer ones* larger, radiate, unequal, expanding; those of the *central ones* equal, smaller, and incurved. *Fruit* (see figs. 4 & 5.) pale brown, “very curious; each *carpel* is hemispherical; on its inner and flat side having a projecting margin, which combines with the opposite one so as to leave no line or furrow between the two, and they form a complete little ball or globe; having, however, when quite ripe, 10 obscure elevated lines or ribs.” (HOOKER.)

This plant is a native of corn-fields in the Levant, Tartary, Greece, Italy, and the South of France, and has, through being much cultivated in Essex, become naturalized in that county, and in a few other places in Britain. The fresh leaves, when bruised, have a very strong and disagreeable scent; the seeds also are strong and disagreeable when fresh, but they become sufficiently grateful by drying. They are used by the distillers for flavouring spirits; by the confectioner for incrusting with sugar; and by the druggist for various purposes. They are recommended as carminative and stomachatic; they are also used to cover the taste of senna, and in spices as currie powder, and seasoning for black puddings; formerly they were steeped in wine, and then dried to render them milder. In some countries the leaves are used in soups and salads.

For information as to the culture of this plant, see YOUNG's *General View of the Agriculture of the County of Essex*, v. ii. p. 57 to 62.; LOUDON's *Encyclopædia of Agriculture*; DON's *Gen. Syst. of Gard. and Bot.*, &c.

**N. B. G.** Sandhurst: W. CHRISTY, Esq. ibid. Near Sandhurst, in the woods on both sides of the road from Hawkhurst to Newenden: 1841; Mr. EDWARD JENNER, and Mr. WALTER W. REEVES.—*Notts*; At Langar, near the seat of Earl HOWE, plentifully, but yet doubtful as a native, (on the authority of Mr. GREGORY); Rev. G. CRABBE, in B. G. This station does not appear to be confirmed by present Botanists: Mr. H. C. WATSON, in N.B.G.—*Suffolk*; On a steep bank in the parish of Bromfield, on a wet clay soil: Mr. D. E. DAVY, in *Sm. Fl. Brit.*—**WALES**. *Pembroke*; “I found a large plant of it in the woods at Stockpole Court, but suspect it is not a native.” Mr. MILNE, in B. G.

**Perennial.**—Flowers in April.

*Root* large, orbicular, compressed, brown, sending out many branched fibres. *Leaves* all radical, heart-shaped, angular, finely toothed; when full grown 3 inches and a half long, and 2 inches and a half broad, beautifully variegated with dark and glaucous green; their under side paler, purplish, with slightly glandular ribs. *Petioles (leaf-stalks)* from 3 to 6 inches long, cylindrical, minutely glandular; tapering and wavy at the base. Young leaves often much more distinctly lobed than the full-grown ones. *Flowers* handsome, pendulous, on naked wavy *stalks*, taller than the leaves. *Calyx* small, divided halfway into 5 egg-shaped segments. *Corolla* white or pale-pink; purplish about the mouth, which is distinctly toothed. *Stamens* very short, concealed within the corolla. After the flowers are over, the flower-stalks curl spirally (see fig. 6.), enclosing the germs in the centre, and, lowering it to the earth, repose on the surface of the soil till the seeds are ready to escape.—This beautiful and admirable process, says Mr. DENSON, in *Gard. Mag.* v. vii. p. 563, is sufficient to suggest to the observant gardener that the seeds of Cyclamen require to be sown the moment they are ripe.

The root of this plant, in a recent state, (for when dried it is said to lose such properties,) is powerfully pungent and acrid, yet, notwithstanding this, it is the chief food of the wild boars of Sicily, where it abounds; hence its common name of Sow-bread.

The accompanying plate is from a very beautiful drawing by Mr. ISAAC RUSSELL, botanical draughtsman, and glass painter, of Oxford, from a specimen kindly communicated to me by Mr. WALTER W. REEVES, of Farnham, Surrey, from its station near Sandhurst, Kent. I have also received fine living plants of it from my kind friend Mr. EDWARD JENNER, of Lewes, Sussex, taken up in the same locality, in November, 1841.

“ In what delightful land  
Sweet scented flower didst thou attain thy birth?  
Thou art no offspring of the common earth,  
By common breezes fann’d.

Thy beauty makes rejoice  
My inmost heart; I know not how ‘tis so,  
Quick coming fancies thou dost make me know,  
For fragrant is thy voice.

Thy home is in the wild,  
'Mong sylvan shades near music haunted springs,  
Where peace dwells all apart from earthly things,  
Like some secluded child.

Thou bringst unto the soul  
A blessing, and a peace inspiring thought,  
And dost the goodness and the power denote,  
Of Him who form'd the whole.”

W. ANDERSON.

LOCALITIES.—In moist woods, and about the banks of rivers.

Tree.—Flowers in March.

A large *tree*, with an ample head, composed of numerous branches and terminal shoots. *Wood* tough, and close grained. *Bark* thick, blackish, somewhat spongy, becoming rough and deeply furrowed with age. *Branches* smooth; rarely hairy when young. *Leaves* on yellowish, somewhat compressed petioles; deltoid, or unequally quadrangular, pointed, serrated, the base more entire, very smooth, deep green, the under side palest. *Catkins* all loose and drooping, 3 or 4 inches long, appearing before the leaves, in March and April; those of the sterile trees are of a dark red, and, being produced in abundance, have a very striking effect. *Stamens* 8, scarcely more with us, though LINNÆUS and LEERS describe 16. *Germen* in the *fertile flower* egg-shaped, but slender, closely sheathed at the base only with the regular cup-like corolla. *Stigmas* 4, awl-shaped, simple, moderately spreading, reddish. *Capsule* roundish, inclosing the *seeds*, which are enveloped in a beautiful white cotton, by which, when the capsule opens, they are disseminated to a great distance by the winds.

This tree is a native of Europe, from Sweden to Italy. It is found also in the north of Africa. In a natural state, the leaves and young shoots are eaten by cattle, and the wood by beavers. The bark, in Russia, is used for preparing morocco leather; and, when it is pulverized it is eaten by sheep. In Britain, it is used, like that of the oak, for tanning leather. The bark of the old trunk, being very thick, light, and corky, is employed by fishermen to support their nets, and, it is said, is used as corks for bottles. In Kamschatka, and in Norway, the poor inhabitants are sometimes reduced to the necessity of drying the inner bark, and grinding it, in order to mix it with their oatmeal. The wood is light, soft, and not apt to splinter, and is used by the turner, and in particular by the bellows-maker, it being very close and light. It is incomparable, according to EVELYN, for all sorts of white wooden vessels, as trays, bowls, and other turner's ware. It is also used for making clogs, and for the soles, as well as heels, of shoes. Like all the other kinds of Poplar, the wood is bad for fuel, as it rather roasts away than burns, giving a great deal of smoke, but no flame. On this account it is considered as excellent for building of cottages, stables, &c.; and also for flooring, as the boards are so slow in taking fire, that the flames are said to have been stopped at that part of a building on fire, where this timber had been used. The buds, macerated in boiling water, and afterwards bruised in a mortar and pressed, yield a fat substance, which burns like wax, and exhales a fine odour. Brooms are made of the twigs, and in some places sheep are fed upon the dried leaves in winter. From the cottony down, which envelopes the seeds, paper and cloth have been manufactured.

The red substances, like berries, upon the leaves and leaf-stalks, as large as a cherry, bulging on one side, and gaping on the other, are occasioned by an insect, the *Apis Populi*.—*Erysiphe adunca*; *Uredo Populi*; and *Erineum Populinum*; three minute parasitic fungi, are common on the living leaves of this species of Poplar about Oxford in the summer: and, later in the season, on the dry fallen leaves, may be found *Sphaeria ceuthocarpa*, of FRIE'S, *Xyloma populinum*, of PERSOON, in abundance.

\* Altered from *Cacóbolus*, which is derived from *kakos*. Gr. *bad*; and *bole*, Gr. a *shoot* or *sprig*; that is to say, a plant destructive of the soil, a bad plant, a weed. DON.

† See folio 37, note †.

‡ See folio 152, a.

**LOCALITIES.**—In hedges, and shady places; very rare.—**Essex**; “ In the margin of my copy of Ray’s Synopsis, against *Cucubalus Plinii* (*C. baccifer*), a former possessor of the book has written as a habitat, *Springfield*. From the colour of the ink and style of writing, it is evident this entry was made soon after the Dillenian edition of the Synopsis appeared. Perhaps some of your readers, on seeing this note, will search in the neighbourhood of Springfield for this plant, which may very readily have been overlooked.” H. O. STEPHENS, in *The Phytologist*, v. i. p. 295.—**Middlesex**; “ In the Isle of Dogs, on the banks of the ditch on the left-hand of the road from Blackwall to the Ferry-House; and there, if not truly indigenous, it is at least perfectly naturalized. I also feel convinced that I have met with it in similar situations in other parts of England; but the plant not being in flower, I have passed it, as I did the first time I saw it in the Isle of Dogs, thinking it to be merely *Cerastium aquaticum*, which in that state it much resembles. It is probable that, like *Polygonum dumetorum*, this plant only requires to have the attention of Botanists directed to it, to lead to its discovery in other localities.” MR. G. LUXFORD, in *Tr. of Linn. Soc.* v. xviii. p. 687. See also, “ *The Phytologist*,” v. i. p. 255.—**WALES. Anglesea**; Gathered in hedges in Anglesea, and communicated to DR. RICHARDSON: *Dilleniarius*, in *Ray’s Syn.* The Rev. HUGH DAVIES, who was well acquainted with the botany of Anglesea, could never find it there.—**SCOTLAND. In hedges in the Isle of Man**: MR. ROESON.—**Edinburghshire**; “ Notwithstanding Sir J. E. SMITH has rejected this plant as not being of British origin, (see Eng. Fl. v. ii. p. 290), we have seen it growing plentifully along with *Silene inflata*, by hedge sides, not far from Roslin Castle near Edinburgh, in the year 1817.” MR. G. DON, in *Gen. Syst. of Gard. and Bot.* v. i. p. 398.

### Perennial.—Flowers in May, June, and July.

*Root* creeping. *Stems* from 2 to 5 feet, or more, long, weak and straggling, leafy, cylindrical, hollow, somewhat hairy, much branched; *branches* opposite at each joint, horizontal or reclining downwards. *Leaves* opposite, on short petioles, egg-spear-shaped, entire, downy. *Flowers* axillary and terminal, drooping, solitary, on slender, downy peduncles (flower-stalks). *Calyx* large, bell-shaped, downy, thin, permanent, frequently tinged with purple. *Corolla* greenish-white, or cream-coloured; *petals* distant, spreading, cloven; claws very narrow, generally more or less crowned at the mouth, but in that respect they vary. *Stamens* inserted into the petals, and the receptacle alternately. *Fruit* an oval, fleshy *capsule*, resembling a berry, very black when ripe, smooth and shining, with one cell, and many seeds. *Seeds* shining, wrinkled, kidney-shaped, blackish.

This plant is a native of Germany, Flanders, France, Switzerland, Carniola, Italy, and Spain, in woods and hedges. Sir J. E. SMITH admitted it into his *Flora Britannica*, and his *English Botany*, on the authority of DILLENIUS’s edition of *Ray’s Synopsis*; but as no one had observed it afterwards up to the time of the publication of his *English Flora*, he considered himself under the necessity of excluding it from that work. Its discovery, however, in the localities above cited seems to give it a claim to a place in this work. JOHNSON, in *Gerarde’s Herbal*, as long ago as 1633, speaks of it as being wild in England, but he had himself only seen it in a garden; and PARKINSON (in 1640) says, in his *Theatrum Botanicum*, p. 760, “ I have sometimes found it by hedge sides in our own Land.”—The berries are said to be poisonous.

*Ledum palustre* Marsh Ledum t.

**LOCALITIES.**—In marshy places; a very doubtful native.—IRELAND.  
“ Detected by Sir CHARLES GIESECKE, Professor of Mineralogy in the University of Dublin, on the north-west of Ireland, where it seems to be a denizen along with *Papaver nudicaule*; for, in the immediate neighbourhood of the station for that plant, namely, Archilhead, Professor GIESECKE took the specimen,” figured in the *Flora Londinensis*, “ in a fresh state, from the hat of a fisherman. The fact of the plant growing amongst the wild islands of that coast cannot be doubted. In the more northern regions, too, of Europe and America, these two plants are almost always found together.” Sir W. J. HOOKER, in *Fl. Lond.*

**Shrub.**—Flowers from April to July.

*Root* branched, woody, running widely and deeply into the ground. *Stems* shrubby, somewhat decumbent, slender, from 1 to 3 feet high, branched, smooth, the younger branches only being covered with a close, rust-coloured down. *Leaves* principally in the younger branches, scattered, horizontal or reflexed, on short petioles, strap-shaped, quite entire, with revolute margins; channelled, smooth, and of a dark green on the upper surface; paler on the under, the mid-rib clothed with close, rust-coloured down; the younger leaves upright, very downy. *Flowers* terminal, corymbose, numerous, on long, simple, upright, or somewhat spreading, pubescent pedicels, with egg-shaped, membranous, brown bracteas at their base, which are at first pubescent, soon clothed with reddish down, and at length nearly smooth. *Calyx* (see fig. 5.) small, permanent, 5-cleft, the segments egg-shaped, spreading, externally downy. *Corolla* (fig. 2.) white, of 5 egg-shaped, spreading, rather concave, nerved petals. *Stamens* (see fig. 2.) 10; *filaments* long, decumbent at the base, afterwards upright, pale purple, longer than the corolla; *anthers* (figs. 3 & 4.) oblong, roundish at the base, bluntly emarginate at the apex, and there opening with a pore on each side. *Germen* egg-shaped; *style* thread-shaped, smooth; *stigma* small. *Capsule* (figs. 5, 6, & 7.) oval, drooping, of 5 cells, and 5 valves. *Seeds* (fig. 10.) very minute, oblong, covered with a pellucid membrane or arillus. See *Fl. Lond.*

This is a small, pretty, evergreen shrub, with leaves resembling those of Rosmary. It is a native of Canada, in swamps, and round the mountain lakes of New York; in Kotzebue's Sound, &c.; also of the north of Europe, as of Denmark, Silesia, &c. Its claim to a place in this work is very slight, as it rests on the authority of only a single specimen having been detected in Ireland, as recorded above, for I have never heard of its having been found in a wild state in any part of Great Britain or Ireland since. It is omitted in the 4th and 5th editions of “The British Flora” by Sir W. J. HOOKER, but, as it had previously been described and figured by that eminent Botanist, in the new series of the “Flora Londinensis,” and afterwards admitted into the 7th edition of Dr. WITHERING’s “Arrangement of British Plants;” and also into the 1st and 2nd editions of Dr. LINDLEY’s “Synopsis of the British Flora;” as well as into the 1st edition of Sir W. J. HOOKER’s “British Flora;” I have ventured to introduce a figure and description of it here, in hope that some future Botanist may be fortunate enough to meet with it again, either in the station recorded for it above, or in some other locality in that part of the coast of Ireland.

The leaves of this plant are used as a substitute for tea by the Canadians in their hunting excursions; and by the Norwegians it is called *Finne-thè*, or tea of the Laplanders. It is sometimes substituted for hops; or placed among corn to drive away mice, and to destroy vermin on sheep and oxen.

*Arthrolobium oblongatum* Lind joint-vetch. ♂

Russell J.M.

## ARTHROLOBIUM\*.

*Linnean Class and Order.* DIADE'LPHIA †, DECA'NDRIA.

*Natural Order.* LEGUMINO'SÆ‡, Juss. Gen. Pl. p. 345.—Sm. Gram. of Bot. p. 174.—Lindl. Syn. p. 75.; Introd. to Nat. Syst. of Bot. p. 87.—Rich by Macgilliv. p. 532.—Sm. Engl. Fl. v. iii. p. 259.—Loud. Hort. Brit. p. 509.—Don's Gen. Syst. of Gard. and Bot. v. ii. p. 91.—Hook. Brit. Fl. (4th edit.) p. 404.—Mack. Fl. Hib. p. 73.—LEGUMINA'CÆ, Loud. Arb. Brit. p. 561.—PAPILIONA'CÆ§, Linn.—ROSALES; sect. CICERINÆ; subsect. LOTIANÆ; type, LOTACEÆ; subtype, HEDYSARIDÆ; Burn. Outl. of Bot. pp. 614, 638, 642, & 657.

**GEN. CHAR.** *Calyx* (fig. 1.) without bracteas, inferior, tubular, permanent; the margin in 5, nearly equal, teeth. *Corolla* (see fig. 2.) papilionaceous, of 5 petals; standard inversely egg-shaped, ascending; wings rather smaller, oblong, curved upwards; keel very small, compressed, of 2 converging petals, with slender distinct claws. *Filaments* (see fig. 3.) 10, 9 in one compressed tube, slit along the upper edge; the tenth hair-like, distinct; all curved upward at the extremity. *Anthers* very small, roundish. *Germen* strap-shaped, compressed. *Style* slender, ascending. *Stigma* capitate, naked. *Legume* (fig. 4.) cylindrical, more or less curved, constantly composed of numerous 1-seeded, indehiscent, cylindrical joints, which are truncate at both ends (see fig. 5). *Seeds* (figs. 6 and 7.) very small, kidney-shaped. *Flowers* yellow, capitate, without a bractea.

Distinguished from other genera, with a smooth *stigma*, in the same class and order, by the very small *keel*; and the cylindrical, curved *legume*, of numerous close single-seeded, indehiscent joints, which are truncate at each end.

Differs from *Ornithopus* (t. 358.) in the flowers being destitute of bracteas; and in the legume being cylindrical, and the joints nearly obsolete.

One species British.

ARTHROLOBIUM EBRACTEATUM. Bractless Joint-vetch. Smooth Bird's-foot. Sand Joint-vetch.

**SPEC. CHAR.** Stem filiform. Stipulas very minute. Leaves all pinnate; with many pairs of equal elliptic-oblong leaflets, the lower ones remote from the stem. Peduncles about equal in length to the leaves, from 1- to 4-flowered.

LOCALITIES.—On sandy ground near Grand Havre, in the *Island of Guernsey*.—On the sea slope of Essex Castle Hill, and on the south coast near Chaise à l'Emauve, Alderney: C. C. BABINGTON, Esq.—In the *Scilly Isles*: Miss YOUNG, in *Hook. Brit. Fl.*

Annual.—Flowers in July and August.

*Root* slender, branched, fibrous, usually furnished with small tubercles. *Stems* several, ascending or decumbent, from 3 to 6 or 8 inches long, slender, simple, cylindrical, striated, leafy, smooth, sometimes zigzag. *Leaves* alternate, all pinnated; *leaflets* opposite, from 3 to 5 pairs, or more, with an odd terminal one, elliptic-oblong, or somewhat inversely egg-shaped, pointed, smooth on the upper side; the under side, as well as the petiole, clothed with a few scattered, white hairs; the lower pair of leaflets remote from the stem. *Stipulas* very minute. *Peduncles* (*flowcr-stalks*) about equal in length to the leaves, axillary, thread-shaped, slender, slightly hairy. *Flowers* yellow, from 1 to 3 together at the summit of the peduncle, and without any bractea. *Calyx* slender, tubular, 5-toothed, smooth. *Corolla* very small, about half as long again as the calyx. *Legumes* (fig. 4.) from about three quarters of an inch to an inch long, more or less curved, slender, cylindrical, so even that the joints are hardly discernible, its surface minutely reticulated, without hairs or downiness. *Seeds* small, one in each joint.

This curious little plant, which appears to have been unknown to LINNÆUS, is a native of Portugal, Spain, the South of France, and Italy, in sandy and gravelly places. It was, I believe, first published as a native of Britain, by Sir W. J. HOOKER, in 1838, in the 4th edition of his excellent "British Flora," on the authority of Mr. BABINGTON and Mr. CHRISTY, who, a short time previous to the publication of that work, had found it in a wild state in the Islands of Guernsey and Alderney. The late Sir J. E. SMITH, in his account of this plant in REES' Cyclopædia, says it was "gathered by the Abbé DURAND at Gibraltar;" and that he had "received it from JAQUIN'S Herbarium for *Ornithopus perpusillus*, with which many Botanists seemed to have confounded it; yet," continues Sir James, "the plants are totally distinct." That this is the case, will be really seen by comparing the above description with that of *Ornithopus perpusillus*, at folio 358, of this work.

The drawing for the accompanying plate was made from a specimen gathered by Mr. CHRISTY, in Guernsey, in 1837, and kindly lent to me from the Herbarium of the Botanical Society of London.

## ADDITIONS and CORRECTIONS.

Descriptions of the following Natural Orders were omitted in their proper places.

## VERBENA'CEÆ, see folio 26.

This order is composed of dicotyledonous *trees* or *shrubs*, or *herbaceous plants*, with generally opposite, simple or compound *leaves*, without stipulae. Their *flowers* are either in opposite corymbs, or spiked alternately; sometimes in dense heads; very seldom axillary and solitary. The *calyx* is tubular, and permanent. The *corolla* monopetalous; with an elongated *tube*; and an irregular 4- or 5-lobed *limb*. The *stamens* are usually 4, and didynamous, sometimes only 2. The *ovary* is 2- or 4-celled, and 2- or 4-seeded, with a single *style*, terminated by an entire or bifid *stigma*. The *fruit* is a berry or drupe, containing a nut with 2 or 4 cells, which are often 1-seeded. The *seeds* are upright, with a straight *embryo*, and very little or no *albumen*.—VERBENA, t. 26, is the only British genus in the order.

ARALIACEÆ, Juss.—Loud. Hort. Brit. p. 519.—Hook. Brit. Fl. (4th ed.) p. 408.—Lindl. Syn. (2nd ed.) p. 321.

The plants of this order are nearly allied to the Umbelliferæ. They are either *Trees*, *Shrubs*, or *Herbs*. Their *calyx* is adherent to the *ovary*, and is entire or cleft. Their *petals* are 4, 5, 10, or none. The *stamens* are equal in number to the *petals*, or twice as many. The *ovary* is 2- or more-celled, with the same number of *styles*, terminated by simple *stigmas*. The *fruit* is fleshy or dry, of several 1-seeded cells. The *seed* is solitary and pendulous, with a minute *embryo*, and fleshy *albumen*.—ADOXA, t. 42; and HEDERA, t. 32, are now referred to this order, from SAXIFRAGEÆ and CAPIFOLIACEÆ.

## AROT'DEE, Juss.—See folio 261.

This order is composed of monocotyledonous, *herbaceous herbs* or *shrubs*. Their *leaves* are sheathing at the base, either with parallel or branching veins; sometimes compound, often heart-shaped. Their *flowers* are unisexual, and arranged upon a spadix (see t. 261. f. 1. d.), which is usually enclosed in a *spatha*, as in ARUM, t. 261, or frequently naked, as in ACORUS, t. 330. The *perianthium* is either wanting, or consisting of 4 or 6 pieces. In the *sterile flowers* the *stamens* are definite or indefinite, hypogynous, and very short; with 1- 2- or many-celled, egg-shaped *anthers*, which are turned outwards. In the *fertile flowers* the *ovary* is superior, 1-celled, very seldom 3 celled, and many-seeded; the *ovules* upright, or pendulous, or parietal; and the *stigmas* sessile, as many as the cells. The *fruit* is succulent or dry, not opening. The *seeds* are either solitary or several; the *embryo* is in the axis of a fleshy *albumen*, with a cleft on one side, in which the *plumula* lies; and the *radicle* is obtuse, and usually next the hilum, but occasionally it is at the opposite extremity. (See Lind. Syn.)—The British genera in this order are ARUM, t. 261.; and ACORUS, t. 330.

## VACCINI'AE, Dec.—See folio 383.

These are dicotyledonous *shrubs*, with alternate coriaceous *leaves*; chiefly inhabiting mountainous situations or high northern latitudes. Their *calyx* is superior, with from 4 to 6 more or less distinct lobes. Their *corolla* is monopetalous, and lobed as often as the *calyx*. The *stamens* are distinct, double the number of the lobes of the *corolla*, and inserted into an epigynous disk. The *anthers* are 2-celled, opening by 2 pores, and often furnished with 2 horns. The *ovary* is inferior, 4- or 5-celled, and 1- or many-seeded. The *fruit* is a succulent *berry*, crowned with the permanent limb of the *calyx*; and the *seeds* are minute, with a fleshy *albumen*.—The British genera are, VACCINUM, t. 383.; and OXYCCOCUS, t. 429.

ELATINEÆ, Cambessédes. Hook. Brit. Fl. (4th ed.) p. 400.—Lindl. Syn. (2nd ed.) Suppl. p. 321.

Small annual, dicotyledonous *plants*, with hollow, rooting *stems*, and opposite, stipulated *leaves*. The *calyx* consists of from 3 to 5 sepals, which are either distinct or slightly united. The *corolla* is from 3- to 5-petaled. The *stamens* are hypogynous, and as many, or twice as many, as the *petals*. The *ovary* has from 3 to 5 cells, and as many *styles*, and capitate *stigmas*. The *fruit* is a *capsule* of from 3 to 5 cells, and as many valves, alternate with the dissepiments, which usually adhere to a central axis. The *seeds* are numerous, with little *albumen*, a straight *embryo*, and a *radical* turned to the hilum.—The only British genus in this order is ELATINE, t. 487.

Folio 487, line 3, after *Natural Order*, add *ELATINEÆ*, Camb.—*Hook. Brit. Fl.* (4th ed.) p. 400.—*Lindl. Syn.* (2nd ed.) Suppl. p. 321.

Folio 487, line 4, for 43, read 48; and in line 7 of the same folio, *erase the reference to Hook. Brit. Fl.* (4th ed.) p. 400,

The following Plants, belonging to genera of which I have not given a figure, have recently been found in situations apparently wild.

### 1. ALY'SSUM.

*Linn. Cl. and Ord. TETRADY'NAMIA, SILICULOSA.*—*Nat. Ord. CRUCIFERÆ.*—*Gen. CHAR.* Calyx equal at the base. Petals emarginate. Stamens all or some of them toothed. Silicle roundish, with a convex disk and a retuse apex; funicle adhering to the base of the dissepiments. Seeds 2 in each cell, with membranous wings. Cotyledons flat, accumbent.

*ALY'SSUM CALY'CINUM*, *Willd.* Large-calyxed Madwort.—*SPEC. CHAR.* Stems diffuse. Leaves strap-spear-shaped, canescent. Calyx permanent. Pods ovoidal, somewhat emarginate, downy, 4 times as long as the style.—*Linn. Sp. Pl.* p. 998.—*Willd. Sp. Pl.* v. iii. pt. i. p. 464.—*Jacq. Fl. Austr.* t. 338.—An annual plant, a native in dry fields both in South and Middle Europe.—Flowering from June to August.

I have a specimen of this plant, gathered by the Rev. ANDREW BLOXAM, in 1836, between Broad and Chamber Hills, Charnwood Forest, Leicestershire.—In the Botany of Charnwood Forest, published in "The History and Antiquities of Charnwood Forest," a very beautiful and extremely interesting work, by T. R. POTTER, (1842,) it is said to be "since extinct" there.—We are informed, in the 5th edit. of Sir W. J. HOOKER's British Flora, that it has been found since in several parts of England and Scotland.—Near Hitchin Common, Herts, 1839: Mr. I. BROWN, *Mag. Nat. Hist.*, new series, v. iv. p. 104.

### 2. CORONI'LLA.

*Linn. Cl. and Ord. DIADE'LPHIA, DECA'NDRIA.*—*Nat. Ord. LEGUMINOSÆ.*—*Gen. CHAR.* Calyx bell-shaped, short, 5-toothed, the two upper teeth approximate, and joined together higher up than the rest. Corolla papilionaceous; claws of the petals usually longer than the calyx. Keel acute. Stamens diadelphous. Legume nearly cylindrical, slender, at length separating into oblong, 1-seeded joints. Seeds egg-shaped or cylindrical.

#### CORONI'LLA VA'RIA Various-flowered Coronilla.

*SPEC. CHAR.* Plant herbaceous, diffuse, flexuous, smooth. Stipulas distinct, spear-shaped. Leaves pinnated; leaflets from 9 to 13, oblong, elliptic, mucronate; the lower ones approximating the stem. Umbels 16- to 20-flowered. Legumes angular, very long, straight.—*Linn. Sp. Pl.* p. 1048.—*Willd. Sp. Pl.* v. iii. pt. ii. p. 1153.—*Curt. Bot. Mag.* t. 258.—A perennial plant, native of Europe and Tauria, in fields and meadows.—Flowering from June to November.—This plant has been found, apparently wild, in Devon, at Bury-head, by Dr. BROMFIELD; and at Linton, by the Rev. Mr. LEVETT. See *Mag. Nat. Hist.* v. ix. p. 603; and *Hook. Brit. Fl.* 5th ed. p. 84.

### 3. ECHINOSPE'R'MUM.

*Linn. Cl. and Ord. PENTA'NDRIA, MONOGY'NIA*—*Nat. Ord. BORAGEÆ.*—*Gen. CHAR.* Calyx inferior, 5-parted. Corolla monopetalous, salver-shaped, or funnel-shaped; throat furnished with short scales; limb 5-parted, obtuse, spreading. Nuts 4, distinct, 1-celled, triangular, compressed, echinate, fixed to the central column, not perforated at the base.

*ECHINOSPE'R'MUM LA'PPULIA.* Burdock Echinospermum.—*SPEC. CHAR.* Stem branched at top. Leaves spear-shaped, beset with incumbent bristle-like hairs, swelled at their base, ciliated. Calyx at length spreading, exceeding the pedicels. Corolla small, exceeding the calyx, with an erectly spreading limb. Nuts furnished with a double row of hooked prickles along the margins, having the disk and sides tubercled.—*Lehm. Asper.* p. 121.—*Myosotis Lappula*, *Linn. Sp. Pl.* p. 189.

I received a specimen of this plant from the Rev. Mr. HOLMES, of Harleston, Norfolk, gathered by him near Southwold, Suffolk, in August, 1839.—See Corrections & Additions at the end of volume V.

<i>Trinia glaberrima</i>	.	468	<i>Carlina vulgaris</i>	405
<i>Helosciadium nodiflorum</i>	.	415	<i>Bidens tripartita</i>	446
<i>Sison Amomum</i>	.	407	<i>Diotsis maritima</i>	499
<i>Bunium flexuosum</i>	.	435	<i>Limbarda tricuspidis</i>	494
<i>Pimpinella Saxifraga</i>	.	411	<b>GYNANDRIA.</b>	<i>Stamens situated upon the style or column, above the germen.</i>
<i>Seseli Libanotis</i>	.	455	<i>Gymnadenia conopsea</i>	409
<i>Ligisticum Scoticum</i>	.	472	<i>Liparis Læselii</i>	414
<i>Silaus pratensis</i>	.	404	<i>Corallorrhiza innata</i>	423
<i>Angelica sylvestris</i>	.	491	<b>MONOCIA.</b>	<i>Stam. &amp; Pist. in separate flowers on the same plant.</i>
<i>Pucedanum officinale</i>	.	419	<i>Zostera marina</i>	458
<i>Tordylium maximum</i>	.	443	<i>Lemna minor</i>	424
<i>Caucalis daucoides</i>	.	459	<i>Carex recurva</i>	440
<i>Echinophora spinosa</i>	.	478	<i>Elyna caricina</i>	484
<i>Chærophyllyum temulentum</i>	.	483	<i>Xanthium strumarium</i>	461
<i>Coriandrum sativum</i>	.	504	<i>Amaranthus Blitum</i>	482
<i>Tamarix Gallica</i>	.	481	<i>Eriocaulon Septangulare</i>	465
<i>Sibbaldia procumbens</i>	.	470	<i>Poterium Sanguisorba</i>	438
<b>HEXANDRIA.</b>	<b>6 stamens.</b>		<i>Castanea vesca</i>	485
<i>Anthericum serotinum</i>	.	464	<b>DIGEIA.</b>	<i>St. &amp; Pist. in separate flowers, and on separate plants.</i>
<i>Asparagus officinalis</i>	.	403	<i>Salix purpurea</i>	434
<i>Lilium Martagon</i>	.	501	<i>Empetrum nigrum</i>	469
<i>Rumex obtusifolius</i>	.	454	<i>Ruscus aculeatus</i>	474
<i>Scheuchzeria palustris</i>	.	503	<i>Hippophaë rhamnoïdes</i>	426
<i>Actinocarpus Damasonium</i>	.	437	<i>Myrica Gale</i>	489
<b>OCTANDRIA.</b>	<b>8 stamens.</b>		<i>Populus nigra</i>	506
<i>Menziesia polifolia</i>	.	449	<i>Hydrocharis Morsus Ranae</i>	441
<i>Erica Tetralix</i>	.	418	<i>Juniperus communis</i>	431
<i>Oxycoccus palustris</i>	.	429		
<i>Elatine hexandra</i>	.	487		
<b>DECANDRIA.</b>	<b>10 stamens.</b>			
<i>Ledum palustre</i>	.	508		
<i>Arbutus Unedo</i>	.	497		
<i>Arctostaphylos Uva-Ursi</i>	.	502		
<i>Scleranthus annuus</i>	.	439		
<i>Cucubalus baccifer</i>	.	507		

# ENGLISH INDEX TO VOL. VI.

	PLATE		PLATE
Alpine Saw-wort	473	Marsh Felwort	498
Annual Cresset	420	Marsh Isnardia	442
Annual Knawel	439	Marsh Ledum	508
Aromatic Orchis	409	Marsh Scheuchzeria	503
Asparagus	403	Marsh Spike-rush	436
Awned Nit-grass	444	Martagon Lily	501
Basil Balm	479	Medlar, Common	493
Bastard Agrimony	446	Medlar, Dwarf Quince-leaved	402
Bear-berries	502	Milk Vetch	453
Berry-bearing Campion	507	Moor Berries	429
Bitter-Vetch	433	Mountain Milk-vetch	495
Black Crow-berry	469	Mountain Spider-wort	464
Black Poplar	506	Mountain Stone-parsley	455
Bulbous Twayblade	414	Oat-like Soft-grass	480
Burdock Clotweed	461	Parsley Piert	439
Burnet Saxifrage	411	Pinnated False Brome-grass	448
Bur-parsley	459	Poverty-weed	457
Butcher's Broom	474	Prickly Samphire	478
Candleberry Myrtle	489	Prickly Twig-rush	500
Carex-like Elyna	484	Procumbent Mudwort	466
Carline Thistle	405	Recurved Carex	440
Cat-mint Balm	486	Red Shanks	454
Cat's Ear	406	Salad Burnet	438
Cat's Tongue, Long-rooted	406	Scotch Cinquefoil	470
Chicory	417	Scotch Lovage	472
Clove Hair-grass	416	Sea Buckthorn	426
Cock's-foot Panick-grass	462	Sea Cudweed	499
Coral-rooted Twayblade	422	Sea Fennel	451
Coriander	504	Sea Grass-wrack	456
Cornish Lovage	475	Sea Mat-weed	408
Cotton-grass, Sheathed	427	Sea-side Cotton-weed	499
Cowberries	429	Sengreen, Great	401
Cow-wheat	457	Shepherd's Cress	423
Crake-berry	469	Six-stamened Water-wort	487
Creeping Reed-grass	412	Smooth Bird's-foot	509
Cross-leaved Heath	418	Smooth Honewort	468
Cyclamen, Ivy-leaved	505	Snake-tail	476
Dames' Violet	425	Sow-bread	505
Decumbent Heath-grass	488	Spanish Chestnut	485
Dock, Common	454	Spear Plume-thistle	410
Dog's-tongue	477	Star-headed Water-Plantain	437
Duck-meat	424	Stinking Hawk's-beard	467
Earth-nut	435	Strawberry-tree	497
Field Calamint	486	Sulphur-wort, Meadow	404
French Tamarisk	481	Sweet Gale	489
Fresh-water Soldier	413	Tongue-under-tongue	453
Frog-bit	441	Tower-mustard, Smooth	430
Galingale, English	452	Trailing Rose-bay	469
Golden Samphire	494	Tuberous-rooted Olobus	433
Gold of Pleasure	447	Turnip	458
Great Goose-grass	466	Upright Pearlwort	460
Ground-nut	435	Water Awl-wort	428
Hart-wort, Great	443	Water Gilly-flower	421
Heath Cress	423	Water Hemp	446
Heath Pea	433	Water Skerret	415
Heath Sedge	440	Water Violet	421
Hedge Honewort	407	White Bent-grass	492
Hoary Stock	445	Whorled Knot-grass	471
Hog's Fennel	419	Wild Angelica	491
Hound's-tongue	477	Wild Blite	482
Houseleek, Common	401	Wild Chervil	483
Irish Heath	449	Wild Succory	417
Jointed Pipewort	465	Wild Teasel	490
Jointed-Vetch, Bractless	509	Willow, Purple	434
Juniper, Common	431	Wood Lyme-grass	496
Knee Holly	474	Wood-reed	412
Lambs' Lettuce	432	Yellow Bent	444
Marsh Cranberry	429	Yellow Rocket	450

*Cryptogamous Plants noticed.*

LIST OF BOOKS REFERRED TO,

THE TITLES OF WHICH ARE ABRIDGED IN THE TEXT.

---

A.

*Abb. Fl. Bedf.*—*Flora Bedfordiensis*; comprehending such plants as grow wild in the county of Bedford. By Charles Abbot, M. A. F. L. S. Bedford. 1798. 1 vol. 8vo.

*Alt. Hort. Kew.*—*Hortus Kewensis*; or, a Catalogue of the Plants cultivated in the Royal Botanic Garden at Kew. By William Aiton, Gardener to His Majesty. 3 vols. 8vo. London. 1789. A second edition by William Townsend Aiton, 5 vols. 8vo. London. 1810—1813.

*Alpin. Exot.*—*Alpinus (Prosper) De Plantis Exoticis, libri duo.* 1 vol. 4to. Venice, 1656.

*Amœn. Acad.*—*Carolii Linnaei Amœnitates Academicæ, sed dissertationes variae Physicæ, Medicæ, Botanicæ, etc.* 10 vol. 8vo. Lugduni Batavorum; Holmiae; & Erlangæ; 1749—1787.

*Ann. du Mus.*—*Annales du Museum d'Histoire Naturelle.* 20 vols. 4to. 1802—1813

*Annals of Botany.*—*Annals of Botany.* by Charles Konig, F. L. S., and John Sims, M. D. F. L. S. 2 vols. 8vo. London. 1805—1806.

B.

*Bab. Fl. Bath.*—*Flora Bathoniensis*; or, A Catalogue of the Plants indigenous to the vicinity of Bath. By Charles C. Babington, M. A. F. L. S. &c. 12mo. Bath. 1834.

*Bab. Fl. Bath. Suppl.*—*Supplement to the Flora Bathoniensis.* By Charles C. Babington, M. A. F. L. S. F. G. S. &c. Bath. 1839.

*Bab. Prim. Fl. Sarn.*—*Primitiæ Flora Sarnicæ*; or, an Outline of the Flora of the Channel Islands of Jersey, Guernsey, Alderney, and Sark, &c. By Charles C. Babington, M. A. F. L. S. F. G. S., &c. 1 vol. 12mo. London. 1839.

*Baines' Fl. Yorksh.*—*The Flora of Yorkshire.* By Henry Baines, 1 vol. 8vo. London. 1840.

*Bauh. Hist.*—*Historia Plantarum Universalis.* John Bauhin. 3 vols. fol. Ebromum. 1650—1651.

*Bauh. Pin.*—*Pinax Theatri Botanici, sive Index in Theophrasti, Dioscoridis, Plinii, &c.* By Caspar Bauhin. 1 vol. 4to. Basil. 1671.

*Bauh. Prod.*—*Prodromus Theatri Botanici.* By Casper Bauhin. 1 vol. 4to. Frankfort, 1620. 2nd ed. Basil, 1671.

*Baxt. Lib. of Agricul. and Hort. Knowl.*—*The Library of Agricultural and Horticultural Knowledge, &c.* Printed and published by J. Baxter, Lewes, Sussex. 1 vol. 8vo. 2nd. ed. 1832.

*Baxt. Stir. Crypt. Oxon.*—*Stirpes Cryptogamar Oxonienses; or, Dried Specimens of Cryptogamous Plants, collected in the vicinity of Oxford.* By William Baxter, A. L. S. and F. H. S. Botanical Gardener to the University. 4to. Oxford. Fasc. 1. 1825. Fasc. 2. 1828.

*Beauv. Agrost.*—*Essai d'une Nouvelle Agrostographie.* By Palisot de Beauvois, A. M. F. G. 1 vol. 8vo. et 4to. Paris, 1812.

*Beesl. Hist. of Banb.*—*The Botany of the neighbourhood of Banbury, with a sketch of the Geology, compiled by Mr. Thomas Beesley.*—Forms a portion of the History of Banbury, by Alfred Beesley. 1 vol. 8vo. Banbury. 1841.

*Benth. Lab.*—*Labiatarum Genera et Species,* by George Bentham. 1 vol. 8vo. London. 1832—1834.

*Besl. Hort. Eyst.*—*Hortus Eystettensis; sive Plantarum, &c.* By Basil Besler. 2 vol. fol. Nuremberg. 1612

*Besser. Enum. Pl. Volh.*—*Enumeration Plantarum in Volhyniæ, Podoliæ, etc.* By W. J. J. Besser. 1 vol. 8vo. Vilnæ. 1822.

*Bigel. Fl. Bost.*—*Florula Bostoniensis.* By J. Bigelow. 1 vol. 8vo. Boston. 1814.

*Bivona Bernardi, Cent.*—*Sicularum Plantarum, Centuria prima.* By A. Bivona Bernardi. 1 vol. 8vo. Palermo. 1808.

*Black. Sp. Bot.*—*Specimen Botanicum quo Plantarum plurium rariorum Angliae indigenarum loci natales illustrantur.* Auctore J. Blackstone, Pharm. Lond. 1 vol. 12mo. Londini. 1746

*Bocc. Mus.*—*Museo di Plante rare della Siciliae, Maltae, Corsicæ, Italie, Piedmonte, è Germania.* Auctore Paulo Boccone. 1 vol. 4to. Venezia. 1679.

*Bocc. Sic.*—*Icones et Descriptiones rariorum Plantarum Siciliae, Melitæ, Galliae, et Italiae, etc.* Auct. Paulo Boccone. 1 vol. 4to. Oxon. 1674.

*Bot. Gall.*—*Botanicum Gallicum, seu synopsis Plantarum in flore Gallica descriptarum, à J. J. Duby digesta.* 2 vols. 8vo. Paris. 1828—1830.

*B. G. or Bot. Guide.*—*The Botanist's Guide through England and Wales.* By Dawson Turner, F. R. S. and L. S. 2 vols. 12mo. London. 1805.

*Bot. Reg. N. S.*—The Botanical Register; consisting of coloured figures of Exotic Plants, cultivated in British Gardens; with their history and mode of treatment. New Series. By Dr. Lindley. Continued Monthly.

*Brot. Fl. Lus.*—Flora Lusitanica. By F. A. Broter. 2 vols. 8vo. Lisbon. 1804.

*Brown. Prod.*—Prodromus floræ Novæ-Hollandiae et insulæ Van-Dieemen. By R. Brown, F. L. S. etc. London. 1810.

*Bryant's Fl. Diætetica*; or, History of Esculent Plants, both Domestic and Foreign. By Charles Bryant. 1 vol. 8vo. London. 1783.

### C.

*Cavan. Ic.*—Icones et Descriptiones Plantarum quæ aut sponte in Hispania crescent, aut in hortis hospitaliarij. By A. J. Cavanilles. 6 vol. fol. Madrid. 1791—1801.

*Clus. Hist.*—Rariorum Plantarum Historia. By C. Clusius. 1 vol. fol. Antwerp. 1601.

*Column. Ecphr.*—Minus cognitarum stirpium, etc. Ecphrasis. By F. Columna. 1 vol. 4to. Rome. 1616.

*Columna's Stirp. Ecphr.*—See *ibid.*

*Cow. Fl. Faver.*—A Floral Guide for East Kent, &c.; being a Record of the habitats of indigenous Plants found in the eastern division of the county of Kent, with those of Faversham, &c. By M. H. Cowell. 1 vol. 8vo. Faversham. 1839.

*Cow. Fl. Guide.*—See *Cow. Fl. Faver.*

*Crantz. Austr.*—Stirpium Austriacarum. By H. J. Crantz. 4 vol. 8vo.

et 4to. 1762—1769.

*Crantz. Fl. Austr.*—See *ibid.*

*Crantz. Stir. Austr.*—See *ibid.*

*Curt. Bot. Mag.*—The Botanical Magazine; or, Flower-Garden Displayed. By William Curtis. London. 1787. Continued, vol. 1 to 12, by W. Curtis; 13 to 53, by J. Sims; the rest by Sir W. J. Hooker.

*Curt. Brit. Entomol.*—British Entomology; being Illustrations and Descriptions of the genera of Insects found in Great Britain and Ireland; containing coloured figures from nature of the most rare and beautiful species, and in many instances of the plants upon which they are found. By John Curtis, F. L. S. &c. &c. 16 vols. 8vo. London. 1823—1840.—The plants in this work are, like the insects, most beautifully executed, and it was my intention to have referred constantly to the work, when the plant was figured, but not having a copy of my own, I could not always get access to it.

*Curt. Fl. Lond.*—Flora Londonensis; or, Plates and Descriptions of such

Plants as grow wild in the environs of London, &c. By William Curtis. London. 1777—1798.

*Curt. Observ. on Brit. Grasses.*—Practical Observations on the British Grasses, especially such as are best adapted to the laying down or improving of meadows and pastures, &c. By W. Curtis. 5th edit. by J. Lawrence. 1 vol. 8vo. London. 1812.

*Curt. on Grasses.*—See *ibid.*

### D.

*Dalech. Hist.*—Historia generalis Plantarum. By Jacob Dalechamps. 2 vols. fol. Leyden. 1586—1587.

*Davies' Welsh Bot.*—Welsh Botany. A systematic Catalogue of the Native Plants of the Isle of Anglesey, in Latin, English, and Welsh, &c. By Hugh Davies, F. L. S. London. 1813.

*Decand. Astr.*—Astragalologia: nempe astragali, biserulæ et oxytropidis, necon phacæ, coluteæ et lesseritæ Historia. By Augustin Pyramus Decandolle. 1 vol. 4to et fol. Paris. 1802.

*Dec. Bot. Gall.*—Botanicum Gallicum, seu synopsis Plantarum in flora Gallica descriptarum. By A. P. Decandolle & J. E. Duby. 2 vol. 8vo. Paris. 1828—1830.

*DC. Fl. Fr.* } Flore Française,  
*De Cand. Fl. Fr.* } ou descriptions succinctes de Toutes les plantes qui croissent naturellement en France, etc. Par M. M. De Lamarck et Decandolle. 5 vols. 8vo. Paris. 1805—1815.

*Decand. Regni Veg.*—Regni Vegetabilis Systema Naturale. Par A. P. Decandolle. 2 vols. 8vo. Paris. 1818—1821.

*Decand. Icon. Pl. Rar.*—Icones Plantarum Galliæ rariorum. Par A. P. Decandolle. 1 vol. 4to. Paris. 1808.

*DC. Prod.* } Prodromus Sys.  
*Dec. Prod.* } tematis Naturalis

*De Cand. Prod.* } regni vegetabilis, sive enumeratio contracta ordinum generum specierum que plantarum huc usque cognitarum, juxta methodi naturalis normas digesta. Auctore Aug. Pyramo De Candolle. 7 vols. 8vo. Paris. 1824—1838.

*Decand. Syst. or De Cand. Syst. Veg.* See *Decand. Regni Veg.*

*Decand. et Spreng. Phil. of Pl.*—Elements of the Philosophy of Plants, containing the principles of Scientific Botany, &c. By A. P. Decandolle and K. Sprengel. Translated from the German. 1 vol. 8vo. Edinburgh. 1821.

*De Cand. Pl. Grass.*—Plantarum Historia Succulentarum. Par A. P. Decandolle. 2 vol. 4to. et fol. Paris. 1791—1803.

- Deer. Catal. Stir. Nott.**—Catalogus Stirpium, etc.; or, A Catalogue of Plants naturally growing, and commonly cultivated in divers parts of England, more especially about Nottingham. 1738.
- Denh. & Clapp. Exp. Afr.**—Travels in northern and central Africa, by Major Denham, Captain Claperton, and Dr. Oudney, in 1822—1824. By D. Denham. 1 vol. 4to. London. 1826.
- Desfont. Fl. Atlant.**—Flora Atlantica, sive Historia Plantarum, quae in Atlante, egeo Tunetano et Algerensi crescunt. By R. L. Desfontaines. 2 vols. 4to. Paris. 1800.
- Dick. Fl. Abred.**—Flora Abredonensis; comprehending a list of the Flowering Plants and Ferns found in the neighbourhood of Aberdeen, &c. &c. By George Dickie, M. A. &c. 1 vol. 12mo. Aberdeen. 1838.
- Dicks. Hort. Sic.**—Hortus Siccus Britannicus; being a Collection of Dried British Plants, named on the authority of the Linnæan Herbarium and other original collections. By James Dickson. 18 fascic. folio. London. 1793—1802.
- Dickson's Pract. Agricul.**—Practical Agriculture; or, A complete system of Modern Husbandry; with the methods of Planting, &c. By R. W. Dickson, M. D. 2 vols. 4to. Lond. 1805.
- Dill. in Linn. Corresp.**—Dillenius in A Selection of the Correspondence of Linnæus and other Naturalists, from the original Manuscripts. By Sir J. E. Smith, M. D. F. R. S., &c. 2 vols. 8vo. London. 1821.
- Dill. Giss.**—Catalogus Plantarum sponte circa Gissam Nascentium; cum Appendice. By J. J. Dillenius. 1 vol. 8vo. Frankfort. 1719.
- Dill. Hort. Elth.**—Horus Elthamensis. By J. J. Dillenius. 2 vol. fol. London. 1732.
- Dill. Musc.**—Historia Muscorum. By J. J. Dillenius. 3 vol. 4to. Oxon. 1741. — Also, Historia Muscorum; A general History of Land and Water, &c. Mosses and Corals, containing all the known species. About 1000 figures, on 85 plates. By J. J. Dillenius. 1 vol. 4to. Lond. 1768.
- Dod. Pemp.**—Stirpium Historia Pemptades sex, sive Libri xxx. By Rambertus Dodonæus, or Dodens. 1 vol. fol. Antwerp. 1583—1616.
- Don's Gen. Syst. of Gard. & Bot.**—A general System of Gardening and Botany; or, A General History of the Dichlamydeous Plants, comprising complete Descriptions of the different orders, &c. By George Don, F. L. S. 4 vols. 4to. London. 1831—1838.

- Lightf. Fl. Scot.*—Flora Scotica; or, A Systematic Arrangement, in the Linnæan method, of the native Plants of Scotland and the Hebrides. By John Lightfoot, M. A. 2 vols. 8vo. Lond. 1777. The same edition, with the life of the Author. By T. Pennant, Esq. Lond. 1789.
- Lindl. Tourn. Alsat.*—F. B. Von. Lindern, Hortus Alsaticus seu Plantæ in Alsatiâ nobilis designans. 1 vol. 12mo Strasburg. 1747.
- Lindl. Fl. Med.*—Flora Medica; A Botanical account of all the more important Plants used in medicine, in different parts of the World. By John Lindley, Ph. D. F. R. S., &c. 1 vol. 8vo. Lond. 1838.
- Lindl. In. to Nat. Syst. of Bot.*—An Introduction to the Natural System of Botany; or, A systematic view of the Organisation, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom, &c. By John Lindley, F. R. S. L. S., &c. 1 vol. 8vo. Lond. 1830.
- Lindl. Syn.*—A Synopsis of the British Flora; arranged according to the Natural Orders: containing Vasculares, or Flowering Plants. By John Lindley, F. R. S. L. S. and G. S., &c. 1 vol. 12mo. London. 1829.—A second edition of the same work, with numerous additions, corrections, and improvements. 1 vol. 12mo. Lond. 1835.
- Link. Enum.*—Enumeratio Plantarum horti regii botanici Beroliensis altera. Henry Fred. Link. 2 vol. 8vo. Berlin. 1821—1822.
- Link. Jahrb.*—Jahrbücher der Gewächskundel. H. F. Link, 1 vol. 8vo. Berlin. 1820.
- Linn. Fl. Lapp.*—Coroli Linnæi. Doct. Med., etc. Flora Lapponica exhibens Plantas per Lapponiam Crescentes, etc. 1 vol. 8vo. Amsterdam. 1737. 2nd ed. By J. E. Smith. 1 vol. 8vo. Lond. 1792.
- Linn. Fl. Suec.*—Caroli Linnæi, Flora Suecica, exhibens Plantas per regnum Suecia crescentes, etc. 2nd ed. 1 vol. 8vo. Stockholm. 1755.
- Linn. Hort. Cliff.*—Hortus Cliffortianus Plantas exhibens quas in Hortistam Vivis quain Siccis, Hartecampi in Hollandia, coluit vir nobilissimus G. Clifford. Auctore C. Linnæo, M. D., etc. 1 vol. folio. Amsterdam. 1737.
- Linn. Virid. Cliff.*—Caroli Linnæi Viridarium Cliffortianum. 1 vol. 8vo. Amsterdam. 1737.
- Linn. Mant.*—Car. à Linné Equ. Aur. Mantissa Plantarum aera, generum editionis vi. Specierum editionis ii. 1 vol. 8vo. Holmiæ. 1771.
- Linn. Spec. Pl.*—Caroli Linnæi, Species Plantarum, etc. 3rd ed. 2 vols. 8vo. Vindobonæ. 1764.
- Linn. Syst. Nat.*—Caroli à Linné, Systema Naturæ, per Regna tria naturæ, secundum classes, ordines, genera, species cum Characteribus, etc. 13th ed. 3 vols. 8vo. Vindobonæ. 1767—1770.
- Linn. Syst. Veg.*—Caroli à Linné, Systema Vegetabilium, secundum classes, ordines, genera, species, cum Characteribus et Differentiis. 13th ed. à J. A. Murray. 1 vol. 8vo. Gottingæ et Gothæ. 1774.
- Linn. Suppl.*—Carolus Linnæus, filius. Supplementum Plantarum. 1 vol. 8vo. Brunswick. 1781.
- Linn. Soc. Tr.*—Transactions of the Linnean Society of London. 18 vols. 4to. Lond. 1791—1840. Continued.
- Lob. Icon.*—Matthias di Lobel. Icones Stirpium. 2 vols. oblong 4to. Antwerp. 1591.
- Lodd. Bot. Cab.*—The Botanical Cabinet, consisting of coloured delineations of Plants from all countries, with a short account of each, directions for management, &c. &c. By Conrad Loddiges and Sons. 20 vols. small 4to. Lond. 1817—1833.
- Loef. It. Hisp.*—Peter Loefling, Iter Hispanicum. Published by Linnæus. 1 vol. 8vo. Stockholm. 1758.
- Loes. Fl. Pruss.*—John Loeselius, Flora Prussica. 1 vol. 4to. Koenigsberg. 1703.
- Loes. Pruss.*—The same.
- Loisel. Fl. Gall.*—J. L. A. Loiseleur Des Lonchamps. Flora Gallica. 2 vols. 12mo. Paris. 1806—1807. 2nd ed. 1828.
- Lois. Not.*—J. L. A. Loiseleur Des Lonchamps. Notice sur les plantes à ajouter à la flore de France. 1 vol. 8vo. Paris. 1810.
- Loud. Arb. Brit.*—Arboretum et Fruticetum Britannicum; or, The Trees and Shrubs of Britain, native and foreign, hardy and half hardy, Pictorially and Botanically delineated; with their propagation, culture, management, and uses in the arts, in useful and ornamental plantations, and in Landscape Gardening; preceded by a historical and geographical outline of the Trees and Shrubs of temperate climates throughout the World. By J. C. Loudon, F. L. S., &c. 8 vols. 8vo. 4 vols. of letter-press, illustrated by above 2500 engravings; and 4 vols. of 8vo. and 4to. plates. Lond. 1838.
- Loud. Arb. et Frutic. Brit.*—The same.
- Loud. Encycl. of Trees & Shrubs.*—An Encyclopædia of Trees & Shrubs; being the Arboretum et Fruticetum Britannicum abridged; containing

the hardy Trees and Shrubs of Britain, native and foreign, scientifically and popularly described; with their propagation, culture, and uses in the arts; and with engravings of nearly all the species. Abridged from the large edition in eight volumes, and adapted for the use of Nurserymen, Gardeners, and Foresters. By J. C. Loudon, F. L. S. H. S., &c. 1 vol. 8vo. London. 1842. Pages 1162. Engravings 2109!

*Loud. Encycl. of Agricul.*—An Encyclopædia of Agriculture; comprising the theory and practice of the Valuation, Transfer, Laying Out, Improvement, and Management of Landed Property and the Cultivation and Economy of the Animal and Vegetable Productions of Agriculture, &c. By J. C. Loudon, F. L. S. H. S., &c. 1 very thick vol. 8vo. Lond. 1831.

*Loud. Encycl. of Gard.*—An Encyclopædia of Gardening; comprising the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape-Gardening, including all the latest improvements; a general History of Gardening in all countries; and a statistical view of its present state; with suggestions for its future progress, in the British Isles. By J. C. Loudon, F. L. S., &c. Illustrated with many hundred engravings on wood, by Branston. A new edit. 1 vol. 8vo. Lond. 1835.

*Loud. Encycl. of Pl.*—An Encyclopædia of Plants; comprising the Description, Specific Character, Culture, History, Application in the Arts, and every other desirable particular, respecting all the Plants indigenous, cultivated in, or introduced to Britain; comprising all the advantages of a Linnean and Jussieuan Species Plantarum, an Historia Plantarum, a Grammar of Botany, and a Dictionary of Botany and Vegetable Culture, &c. Edited by J. C. Loudon, F. L. S., &c. The specific characters by an eminent Botanist; the drawings by J. D. C. Sowerby; and the engravings by R. Branston. 1 thick vol. 8vo. London. 1829.—Pages 1159. Engrav. nearly 10,000.

*Loud. first add. Suppl. to Encycl. of Plants.*—First additional Supplement to Loudon's Encyclopædia of Plants; comprising the specific Characters, Description, Culture, History, Application in the Arts, and every other desirable particular respecting all the plants originated in, or introduced into Britain, between the first publication of the work in 1829, and January, 1840. With a new general Index to the whole work. Edited by J. C. Lou-

don, F. L. S., &c. Prepared by W. H. Baxter, jun. and revised by G. Don, F. L. S. 1 vol. 8vo. Lond. 1841.

*Loud. Gard. Mag.*—The Gardener's Magazine, and Register of Rural and Domestic Improvement. Conducted by J. C. Loudon, F. L. S. &c. 18 vol. 8vo. 1826—1842. Continued in Monthly Numbers.

*Loud. Hort. Brit.*—Loudon's Hortus Britannicus. A Catalogue of all the Plants indigenous, cultivated in, or introduced to Britain. Part I. The Linnean Arrangement, in which nearly 30,000 species are enumerated; with the systematic name and authority, accentuation, derivation of Generic names, literal English of Specific names, synomyms systematic and English of both genera and species, Habit, Habitation in the Garden, indigenous habitation, popular character, height, time of flowering, colour of the flower, mode of propagation, soil, native country, year of introduction, and reference to figures; preceded by an introduction to the Linnean system.—Part II. The Jussieuan Arrangement, of nearly 4000 genera, with an introduction to the natural system, and a general description and history of each order. A new edition, with supplements including all the new plants down to March, 1839; and with a new general Index to the whole work. Edited by J. C. Loudon, F. L. S., &c. Lond. 1839.

*Loud. Mag. Nat. Hist.*—The Magazine of Natural History, and Journal of Zoology, Botany, Mineralogy, Geology, and Meteorology. Conducted by J. C. Loudon, F. L. S. G. S., &c. 9 vols. 8vo. London. 1829—1836. A new series of the same work conducted by C. Charlesworth, F. G. S. 4 vols. 8vo. Lond. 1837—1840.

*Luxf. Reig. Fl.*—A Flora of the neighbourhood of Reigate, Surrey, containing the Flowering Plants and Ferns. By George Luxford, A. L. S. &c. 1 vol. post 8vo. Lond. 1838.

M.

*Mack. Catal. Pl. Ire.*—A Catalogue of the Plants found in Ireland, with descriptions of some of the rarer sorts. By James Townsend Mackay, M. R. I. A., A. L. S., &c. Part I. 1 vol. 4to. Dublin. 1825.

*Mack. Fl. Hibern.*—Flora Hibernica; comprising the Flowering Plants, Ferns, Characeæ, Musci, Hepaticæ, Lichenes, and Algae, of Ireland. Arranged according to the natural system, &c. By J. T. Mackay, M. R. I. A., &c. 1 vol. 8vo. Dublin, 1836.

*Macr. Man. Brit. Bot.*—Manual of British Botany; in which the orders and genera are arranged and described according to the natural system of De Candolle; with a series of analytical Tables for the assistance of the student in the examination of the plants indigenous to, or commonly cultivated in, Great Britain. By D. C. Macreight, M. D. &c. 1 vol. post 8vo. Lond. 1837.

*Mart. Fl. Rust.*—Flora Rustica: exhibiting accurate figures of such plants as are either useful or injurious in Husbandry. Drawn and engraved by F. P. Nodder, and coloured under his inspection, with scientific characters, popular descriptions, and useful observations. By T. Martyn, B.D., F.R.S., L.S., &c. 4 vols. 8vo. Lond. 1792—1794.

*Mart. Mill. Gard. Dict.*—The Gardener's and Botanist's Dictionary; containing the best and newest methods of cultivating and improving the Kitchen, Fruit, and Flower Garden, and Nursery, &c. By the late P. Miller, F. R. S. To which are now first added a complete enumeration and description of all the plants hitherto known, &c. By T. Martyn, B. D., F. R. S., 2 vols. in 4 Parts, fol. Lond. 1807.

*Matth. Valgr.*—P. A. Matthiolus, Commentarii in Sex Libros Pedacii Dioscoridis; apud Valgrisium. 2 vols. folio. Venice. 1583.

*Maund. Bot. Gard.*—The Botanic Garden; consisting of highly finished representations of hardy Ornamental Flowering Plants, cultivated in Great Britain. By B. Maund, F. L. S.; several volumes. Lond. 1824—1843. Continued Monthly.

*Mem. Caled. Hort. Soc.*—Memoirs of the Caledonian Horticultural Society. 8vo. Edinburgh. 1810. Continued.

*Mem. Mus.*—Mémoires du Muséum d'Histoire Naturelle. 4to. Paris. 1815, and following years.

*Merr. Pin.*—Pinax Rerum Naturalium Britannicarum, continens Vegetabilia, Animalia et Fossilia, in hac insula repperta inchoatus. Auctore Christophore Merrett. 1 vol. post 8vo. Lond. 1666.

*Mich. Gen.*—Nova Plantarum Genera juxta Tournefortii Methodium disposita, etc. Auctore P. A. Michelio. 1 vol. 4to. Florentiae. 1729.

*Mill. Icon.* } Figures of the most *Miller's Plates.* } Beautiful, Useful, and Uncommon Plants described in the Gardener's Dictionary, exhibited on 390 copper plates, &c. By P. Miller, F. R. S., &c. 2 vols. folio. Lond. 1760.

*Mill. Illust.*—Illustrations of the sexual system of Linnaeus. By John Miller. 2 vols. folio. Lond. 1777.

*Miss Kent's Sylvan Sketches.*—See *Kent's Sylvan Sketches.*

*Mænch Meth.*—Conrad Moench. Methodus plantas horti et agri Marburgensis, à staminum situ describendi. 1 vol. 8vo. Marburg. 1794.

*Moral of Flowers.*—The Moral of Flowers, illustrated by coloured Engravings. 2nd edit. Lond. 1835.

*Moris. Hist. Pl. Uni.*—Plantarum Historia Universalis Oxoniensis, etc. Auctore R. Morison, M. D., &c. 3 vols. fol. Oxford. 1715.

*Moris. Hort. Bles.*—Hortus regius Blesensis austus; cum observationibus generalioribus. Auctore R. Morison. 1 vol. 8vo. Lond. 1669.

*Murr. North. Fl.*—The Northern Flora; or, A description of the Wild Plants belonging to the North and East of Scotland; with an account of their places of growth and properties. By Alexander Murray, M. D. Part I. 8vo. Edinburgh. 1836.

N.

*N. B. G.* } The New Botanist's Guide to the localities of the rarer Plants of Britain, on the plan of Turne and Dillwyn's Botanist's Guide. By H. C. Watson. 2 vols. 12mo. Lond. 1835—1837. Vol. 1. England and Wales. Vol. 2. Scotland and adjacent Isles.

P.

*Paley's Nat. Theol.*—Natural Theology; or Evidences of the Existence and Attributes of the Deity, collected from the appearances of Nature. By W. Paley, D. D. Illustrated by a series of plates and explanatory notes, by James Paxton, M. R. C. S., &c. 2 vols. 8vo. 2nd ed. Oxford. 1828. A 3rd ed. in 1836.

*Pall. Fl. Ross.*—P. S. Pallas, Flora Rossica; seu stirpium imperii Rosisci, per Europam et Asiam indigenarum, descriptiones et icones. 2 vols. folio. Petersburg. 1784—1788.

*Paml. Pl. of Batt. and Clap.*—A Catalogue of the rarer species of indigenous Plants, which have been observed growing in the vicinity of Battersea and Clapham, &c. By W. Pamplin, jun. Pamphl. post 8vo. Clapham. 1827.

*Park. Parad.*—Paradisi in Sole Paradisi Terrestris. A Garden of all sorts of pleasant flowers which our English ayre will permitt to be noured up, &c. Collected by John Parkinson, apothecary of London. 1 vol. fol. Lond. 1629. A second impression in 1656.

*Park. Theatr. Bot.*—Theatrum Botanicum. The Theater of Plants, or an universall and compleate Herball. Composed by John Parkinson, apothecary of London, &c. 1 vol. fol. o. Lond. 1640.

- Penn. Voy. to the Hebrides.**—Tour in Scotland and to the Hebrides, in 1769 and 1772. By T. Pennant. 3 vols. 4to. Lond. 1774—1776.
- Perry's Pl. Varvic. Sel.**—Plantæ Varvicenses Selectæ; or Botanist's Guide through the County of Warwick. By W. G. Perry. 1 vol. 12mo. Warwick. 1820.
- Pers. Syn. Pl.**—Synopsis Plantarum seu Enchiridium Botanicum, etc. Curante C. H. Persoon. 2 vol. 12mo. Paris. 1805—1807.
- Pers. Syn.**—The same.
- Pers. Syst. Veg.**—Caroli à Linué equitatis Systema Vegetabilium secundum Classes, Ordines, Genera, Species, cum Characteribus et Differentiis, etc. 15th ed.; à C. H. Persoon. 1 vol. 8vo. Gottingæ. 1797.
- Pet. Gazoph.**—Gazophylacium Naturæ et Artes, etc. Decades 5. fol. Lond. 1702—1704.
- Pet. Herb. Brit.**—Herbarii Britannici Clarissimi D. Raii Catalogus cum Iconibus. By James Petiver. folio, Lond. 1767. In the 2nd vol. of his works, 2nd ed.
- Pet. Brit.**—The same.
- Pet. Th. Gen.**—Genera nova Madagascariensis, 13 fasc. 8vo. 1810.
- Phil. Comp. for the Orch.**—The Companion for the Orchard. An Historical and Botanical account of Fruits known in Great Britain. By Henry Phillips, F.H.S. new ed. 1 vol. 8vo. Lond. 1831.
- Phil. Cult. Veg.**—The Companion for the Kitchen Garden. History of cultivated Vegetables, etc. By Henry Phillips, F. H. S. new ed. 2 vols. 8vo. Lond. 1831.
- Phil. Syl. Fl.**—Sylva Florifera. The Shrubbery Historically and Botanically treated; with observations on the formation of ornamental Plantations, and picturesque Scenery. By H. Phillips, F. H. S. 2 vols. 8vo. Lond. 1823.
- Phil. Pom. Brit.**—Pomarium Britannicum; an Historical and Botanical account of Fruits known in Great Britain. By H. Phillips. 2nd edit. 1 vol. 8vo. Lond. 1821.
- Phil. Trans.**—Philosophical Transactions of the Royal Society of London. 4to. London. From 1665. Continued annually.
- Pl. Faversh.** See Jacob's Pl. Faversh.
- Plot's Nat. Hist. Oxf.**—The Natural History of Oxfordshire; being an Essay towards the Natural History of England. By Robert Plot, LL.D. 2nd ed. 1 vol. fol. Oxford. 1705.
- Pluk. Alm. Bot.**—Leonard Plukenet. Almagestum Botanicum, sive Phyt. Onosmasticon. 1 vol. 4to. Lond. 1696.
- Pluk. Phyt.**—Leonard Plukenet. Phytographia, sive stirpium illustriorum, etc. 4 vol. 4to. Lond. 1691.
- pendium tabularum Botanicarum; in quo plantæ 272, in Italia nuper detectæ, recensentur. Accessit ejusdem epistola ad Gul. Sherardum, Anglum. 1 vol. 4to. Padua. 1718.
- Prod. Fl. Græcæ.**—Floræ Graecæ Prodromus: sive plantarum omnium enumeratio quas in provinciis aut insulis Græciæ invenit Johannes Sibthorp, M. D., etc.; cum annotationibus elaboravit Jacobus E. Smith, M. D., etc. 2 vol. 8vo. Lond. 1806—1813.
- Prof. Hensl. in Cat. Brit.**—A Catalogue of British Plants, arranged according to the Natural System, with the synonyms of De Candolle, Smith, Lindley, and Hooker. By the Rev. J. S. Henslow, M. A. 2nd ed. 1 vol. 12mo. Cambridge. 1835.
- Pursh. Fl. Amer. Sept.**—Flora Americae Ponited. Comp.—I. Pontedera, Comiceæ Septentrionalis; or, A systematic Arrangement and Description of the Plants of North America. By F. Pursh. 2 vols. 8vo. Lond. 1814.
- Purt. Midl. Fl.**—A Botanical Description of British Plants, in the Midland Counties. By T. Perton, Surgeon, Alcester. 2 vols. 12mo. Stratford-upon-Avon. 1817.—An Appendix to the Midland Flora; by T. Perton, F.L.S., &c. 2 vols. 12mo. Lond. 1821.
- R.
- Ray's Cant.**—Catalogus Plantarum circa Cantabrigianas nascentium. Auctore Joanne Raio. 1 vol. 8vo. Cambridge. 1660.
- Ray's Syn.**—Joannes Raii Synopsis Methodica Stirpium Britannicarum, etc. 3rd ed. 1 vol. 12mo. Lond. 1724.—This edition was edited by DILLENIUS, and is the one constantly referred to in this work, unless the contrary is expressed.
- Redout. Liliac.**—P. J. Redoute, Les Liliacées. 8 vols. fol. Paris. 1802—1816.
- Reichenb. Icon. Bot.**—Iconographia Botanica; seu icones plantarum rariorum, et minus rite cognitarum; à H. G. L. Reichenbach. 4 vol. 4to. Lipsig. 1823—1826.
- Rehl. Fl. Cant.**—Richardi Relhan, A. M., etc. Flora Cantabrigiensis, exhibens plantas agro Cantabrigiensi indigenas, secundum systema sexuale digestas, etc. 1 vol. 8vo. Camb. 1785. A 3rd ed. 1 vol. 8vo. Camb. 1820.
- Retz. Prod. Fl. Scand.**—A. J. Retzius, Flora Scandinaviae prodromus. 2nd ed. 1 vol. 8vo. Lipsig. 1795.
- Retz. Prod.**—The same.
- Retz. Obs.**—A. J. Retzius. Observations Botanicæ. 6 fasc. fol. Leip. 1779—1781.

- Rev. G. E. Smith's Pl. of S. Kent.*—A Catalogue of rare or remarkable Phænogamous Plants, collected in South Kent; with descriptive notices and observations. By Gerard Edwards Smith, of St. John's College, Oxford. Pamphl. 8vo. Lond. 1829.
- Rheede's Hort. Mal.*—H. A. Von Rheed. Hortus Malabaricus, de variis arboribus, etc. 12 vols. fol. Amstel. 1686—1703.
- Rich. by Macgilliv.*—Elements of Botany and Vegetable Physiology, including the characters of the natural families of Plants, &c. By A. Richard, M. P. Translated from the 4th edit. By W. Macgillivray, A.M. 1 vol. 8vo. Edinburgh. 1831.
- Rich. Mem. Mus.*—Richard in Mémoires due Muséum d'Histoire Naturelle. 4to. Paris, 1815, and following years.
- Rin. Pentap. Irr.*—A. Q. Rivinus. Ordo plantarum flore errregulari tetrapetalo. 1 vol. fol. Leipsig. 1699.
- Rob. Brit. Fl.*—The British Flora, containing the select names, characters, places of growth, duration, and time of flowering of the plants growing wild in Great Britain. By Stephen Robson. 1 vol. 8vo. York. 1777.
- Roemer et Schultes Syst. Veget.*—J. J. Roemer et F. A. Schulthes, Systema Vegetabilium. 7 vols. 8vo. Stuttgart. 1817—1835. Continued.
- Roemer et Schultes Syst.*—The same.
- Rose's Elem. of Bot.*—The Elements of Botany; containing the History of the Science, &c. Being a translation of the Philosophia Botanica, and other treatises of the celebrated Linnæus. To which is added, an Appendix, wherein are described some Plants lately found in Norfolk and Suffolk, &c. By Hugh Rose, 1 vol. 8vo. Lond. 1775.
- Roth. Fl. Germ.*—Albert William Roth, Tentamen Floræ Germanicæ, etc. 3 vols. 8vo. Leipsig. 1788.
- Rudb. Camp. Elysi.*—Campi Elysi Liber primus et secundus. Opera Olai Rudbeckii Patris et Filii. 2 vols. fol. Upsala. 1701.—Only 3 copies of the first volume, and 6 of the second, of this work, are said to be extant. See folio 95, 2nd page.
- Rudb. Elys.*—The same.  
S.
- Salisb. Bot. Comp.*—The Botanist's Companion, or an Introduction to the Knowledge of Practical Botany and the uses of Plants, &c. By W. Salisbury. 2 vol. 12mo. Lond. 1816.
- Salisb. Icon. Stirp. Rar.*—Icones Stirpium rariorum. By R. A. Salisbury. 1 fasc. fol. Lond. 1791.
- Salisb. Prod.*—Prodromus Stirpium in Horto ad Chapel Allerton vigentium;
- à R. A. Salisbury, F.R.S. &c. and L.S. 1 vol. 8vo. Lond. 1796.
- Salic. Wob.*—Salictum Woburnense. By His Grace the Duke of Bedford. 1 vol. 4to. Lond. 1829.
- Scheuchz. Agrost.*—Agrostographia sive Graminum, Juncorum, Cyperorum, etc. Historia Auctore Johanne Scheuchzerio. 1 vol. 4to. Tiguri. 1719.
- Scheuchz. Prod.*—Johannis Scheuchzeri Agrostographia Helvetiae Prodromus. 1 vol. fol. Tiguri. 1708.
- Schkuhr. Car.*—Christian Schkuhr Riedgräsern (Carices). 8vo. Wittenberg. 1801.
- Schrad. Fl. Germ.*—H. A. Schrader, Flora Germanica. 1 vol. 8vo. Göttingen. 1806.
- Schreb. Besch. Graser.*—J. C. D. Von Schreber, Beschreibung der Gräser nebst ihren Abbildungen nach der Natur. 2 vol. fol. Leip. 1769—1779.
- Schreb. Lips.*—J. C. D. Von Schreber Spicilegium Floræ Lipsicæ. 1 vol. Leipzg. 1771.
- Scop. Fl. Carn.*—J. A. Scopoli, Flora Carniolica. 1 vol. 8vo. Vienna. 1768. 2nd ed. 2 vols. 8vo. Vienna. 1772.
- Sibb. Scot. Ill.*—Scotia Illustrata sive Prodromus Historia Naturalis, etc. Auctore R. Sibbaldo, M.D. &c. 1 vol. fol. Edinburgh. 1684.
- Sibth. Fl. Græca.*—See *Flora Græca*.
- Sibth. Fl. Oxon.*—Flora Oxoniensis, exhibens Plantas in agro Oxoniensi sponte crescentes, secundum systema sexuale distributas. Auctore Joanne Sibthorpi, M. D., F. R. S., &c. 1 vol. 8vo. Oxford. 1794.
- Sincl. Hort. Gram. Wob.*—Hortus Gramineus Wobernensis; or, An account of the results of experiments on the produce and nutritive qualities of different Grasses and other plants, &c. By G. Sinclair, F. L. S. 3rd ed. 1 vol. 8vo. Lond. 1826.
- Sm. Comp.*—Compendium Floræ Britannicæ. Auctore J. E. Smith, M. D. P. L. S., etc. 3rd ed. 12mo. Lond. 1818.
- Sm. Engl. Fl.*—The English Flora. By Sir J. E. Smith, M. D. F. R. S. P. L. S., &c. 4 vols. 8vo. Lond. 1824—1828.
- Sm. Fl. Brit.*—Flora Britannica. Auctore J. E. Smith, M. D. P. L. S. etc. 3 vols. 8vo. Lond. 1800—1804.
- Sm. Gram. of Bot.*—A Grammar of Botany, illustrative of artificial, as well as natural, classification; with an explanation of Jussieu's system. By Sir J. E. Smith, M. D. F. R. S., &c. 1 vol. 8vo. Lond. 1821. 2nd edit. 1826.
- Sm. Ic. Pict. Pl. Rar.*—Icones Pictæ Plantarum; à J. E. Smith, M. D., &c. 2 fasc. fol. Lond. 1790—1793.
- Sn. Prod. Fl. Græc.*—See *Prod. Fl. Græc.*
- Spreng. Linn. Syst. Veg.*—Carolus

- Linné Systema Vegetabilium.* 16th ed. Curante C. Sprengel. 5 vols. 8vo. Gottingen. 1825—1828.
- Spreng. Spec. Umb.*—Plantarum Umbelliferarum denuo disponendarum prodromus; à K. Sprengel. 1 vol. 8vo. Halle. 1813
- Spreng. Umb. Spec.*—The same.
- Steph. and Church. Med. Bot.*—Medical Botany; or, Illustrations and descriptions of the Medical Plants of the London, Edinburgh, and Dublin Pharmacopæias, etc. By J. Stephenson, M.D. F.R.S., &c., and J. M. Churchill, F.L.S., &c. 4 vols. 8vo. Lond. 1831.
- Stillingf. Misc. Tracts.*—Miscellaneous Tracts relating to Natural History, Husbandry, and Physick, &c. By B. Stillingfleet. 4th ed. 1 vol. 8vo. Lond. 1791.
- Stokes' Bot. Mat. Med.*—A Botanical Materia Medica. By J. Stokes. 4 vols. 8vo. Lond. 1812.
- Swartz. Gen. et Spec. Orch.*—Olaus Swartz, Genera et Species Orchidearum. 1 vol. 8vo. 1805.
- Sw. Orch.*—The same.
- Swartz. in Stockh. Trans.*—Swartz in Transactions of the Royal Society of Stockholm. In Swedish. Stockholm. 1739—1820, &c.
- Sylvan Sketches.* } See Kent's *Sylvan Sylv. Sket.* } Sketches. T.
- Thoms. Fl. of Berw.*—A Catalogue of Plants growing in the vicinity of Berwick-upon-Tweed. By J. V. Thompson, Esq. 1 vol. 8vo. Lond. 1807.
- Thore Chl. Land.*—Essai d'une Chloris du département des Landes. Par John Thore. 1 vol. 8vo. Dax. 1803.
- Thorn. Fam. Herb.*—A new Family Herbal; or Popular account of the nature and properties of the various Plants used in Medicine, diet, and the arts. By R. J. Thornton, M. D. &c. With the plants engraved on wood, by T. Bewick. 1 vol. 8vo. Lond. 1810.
- Threl. Syn. Hibern.*—Synopsis Stirpium Hibernicarum, etc. Being a short Treatise of Native Plants, especially such as grow spontaneously in the vicinity of Dublin, &c. By Caleb Threlkeld, M. D. 1 vol. 12mo. Dublin. 1726.
- Time's Telescope.*—Time's Telescope; or, A complete Guide to the Almanack: containing an explanation of Saints' Days and Holidays, Astronomical Occurrences, the Naturalist's Diary, &c. Published annually from 1814 to 1833. 20 vols. 12mo. Lond. 1814—1833.
- Torrey & Gray's Fl. of N. Amer.*—A Flora of North America; containing abridged descriptions of all the known indigenous and naturalized Plant\* growing north of Mexico. Arranged according to the Natural System. By John Torrey and Asa Gray. Vol. I. and Parts 1 and 2, of vol. II. 8vo. New York. 1838—1842.
- Tourn. Inst.*—Joseph Pitton Turnefort Aquisextiensis, etc. Institutiones Rei Herbariae. 3 vols. 4to. Paris. 1700.—ibid. Corollarium Institutio- num Rei Herbariae, etc. 1 vol. 4to. Paris. 1703.
- Tracts on Nat. Hist.*—Tracts relating to Natural History. By J. E. Smith, M.D. F.R.S., etc. 1 vol. 8vo. Lond. 1798.
- Trag. Hist.*—Jerome Tragus, De Stirpium Nomenclaturis, etc. 1 vol. 4to. Strasburgh. 1552.
- Trev. Farœ Isl.*—On the Vegetation and Temperature of the Faroe Islands. By W. C. Trevalyan, Esq. Pamp. 8vo. From Edinb. *New Phil. Journ.*, January, 1835.
- Tr. Linn. Soc.*—The Transactions of the Linnean Society of London. 18 vols. 4to. Lond. 1791—1841. Continued. V.
- Vaill. Bot. Par.*—S. Vaillant. Botanicum Parisiense. 1 vol. fol. Leyden and Amsterdam. 1727.
- Vaill. Par.*—The same.
- W.
- Wahlenb. Fl. Lapp.*—Flora Lapponica, in itineribus, 1800—1810 denuo investigata, etc.; à G. Wahlenberg. 1 vol. 8vo. Berlin. 1812.
- Walk. Fl. of Oxf.*—The Flora of Oxfordshire, and its contiguous counties, (comprising the Flowering Plants only,) arranged in easy and familiar language, according to the Linnean and Natural Systems; preceded by an introduction to Botany, with illustrative Plates. By Richard Walker, B. D., F. L. S., Fellow of Magdalene College, Oxford. 1 vol 8vo. Oxford. 1833.
- Wallr. Sched. Crit.*—F. W. Wallroth, Schedulæ criticae de Plantis Floræ Halensis selectis. Corollarium novum ad C. Sprengelii Floram Halensem. vol. I. Phanerogamia. 8vo. Halle. 1822.
- Warn. Pl. Woodf.*—Plantæ Woodfordienses; a Catalogue of the more perfect plants growing spontaneously about Woodford, in the county of Essex. By R. Warner. 1 vol. 12mo. Lond. 1771.
- Web. Gott.*—G. H. Weber, Specilegium Floræ Gottingensis. 1 vol. 8vo. Gotha. 1778.
- Weïhe and Nees Rub. Germ.*—A. Weïhe et Nees, Von Esenbeck, Rubi Germanici. 1 vol. fol. Bonn. 1822.
- Wild Garland.*—The Wild Garland; or Prose and Poetry connected with Eng-

- lish Wild Flowers, &c. 1 vol. 12mo.  
Lond. 1827.
- Wild. Spec. Pl.*—Caroli à Linné Species Plantarum exhibentes Plantas rite cognitas ad Genera relatas cum differentiis, etc., secundum systema sexuale digesta. Curante C. L. Willdenow. 5 vols. 8vo. 1797—1810.
- Winch's Fl. of Northumb. & Durh.*—Flora of Northumberland & Durham. By N. J. Winch. From the Trans. of the Nat. Hist. Soc. of Northumb. Durh. and Newcastle-upon-Tyne. 1 vol. 4to. Newcastle. 1831.
- With.* 1st ed.—A Botanical Arrangement of all the Vegetables naturally growing in Great Britain, &c. By W. Withering, M. D. 2 vols. 8vo. Birmingham. 1776.
- With.* 2nd ed.—A Botanical Arrangement of British Plants; including the uses of each species, &c. By W. Withering, M. D., F. R. S., &c. With a new set of references to figures; by J. Stokes, M. D., &c. 2nd ed. 3 vols. 8vo. Birmingham. 1787—1792.
- With.* 5th ed.—A systematic Arrangement of British Plants; with an easy introduction to the study of Botany, illustrated by copper-plates. By W. Withering, M. D., F. R. S., &c. 5th ed. by W. Withering, Esq. 4 vols. 8vo. Birmingham. 1812.
- With.* 7th ed.—An Arrangement of British Plants, according to the latest improvements of the Linnean System, &c. By W. Withering, &c. 7th ed. by W. Withering, Esq. LL.D. F. R. S. &c. 4 vols. 8vo. Lond. 1830.
- Woodv. Med. Bot.*—Medical Botany; containing systematic and general descriptions, with plates, of all the Medicinal Plants, indigenous and exotic, &c. By W. Woodville, M. D. &c. 3 vols. 4to. Lond. 1790—1793.
- Woodv. Med. Bot. Suppl.*—A Supplement to Medical Botany, &c. By W. Woodville, M. D., F. L. S., &c. 1 vol. 4to. Lond. 1794.

INDEX OF THE GENERA ARRANGED ACCORDING TO THE  
LINNEAN SYSTEM.

*A short explanation of the classes will be found in a note (usually note †.) at the bottom of the pages referred to.*

**Class I.—MONANDRIA. 1 sta. (p. 49.)**

**Order I.—MONOGYNIA. 1 style.**

vol. plate

Salicornia herbacea	4.	320
Hippuris vulgaris	1.	49

**Class II.—DIANDRIA. 2 sta. (p. 50.)**

**Ord. I.—MONOGYNIA. 1 style.**

Ligustrum vulgare	2.	119
Veronica Chamædrys	1.	50
Pinguicula vulgaris	3.	209
Utricularia vulgaris	5.	349
Lycopus Europæus	3.	167
Salvia pratensis	1.	65
Ciræa Lutitiana	1.	9
Fraxinus excelsior	5.	382
Cladium mariscus	6.	500

**Ord. II. DIGYNIA. 2 styles.**

Anthoxanthum odoratum	2.	99
-----------------------	----	----

**Class III.—TRIANDRIA. 3 sta. (pp. 45 and 56.)**

**Ord. I.—MONOGYNIA. 1 style.**

Valeriana rubra	2.	90
Fedia carinata	6.	432
Crocus nudiflorus	2.	137
Trichonema Bulbocodium	3.	202
Iris Pseud-acorus	2.	82
Cyperus longus	6.	454
Schœnus nigricans	4.	268
Rhynchospora alba	5.	396
Scirpus maritimus	4.	264
Blysmus compressus	4.	308
Eleocharis palustris	6.	436
Eriophorum vaginatum	6.	427
Nardus stricta	4.	300

**Ord. II.—DIGYNIA. 2 styles.**

Alopecurus pratensis	1.	45
Phalaris canariense	1.	56
Ammophila arundinacea	6.	408
Phleum pratense	1.	68
Lagurus ovatus	4.	256
Milium effusum	4.	247
Gastridium lendigerum	6.	444
Stipa pennata	3.	200
Polypogon monspeliensis	3.	208
Calamagrostis Epigejos	6.	412
Agrostis alba	6.	492
Catabrosa aquatica	4.	252
Aira caryophyllea	6.	416
Melica nutans	2.	144
Holcus lanatus	1.	64
Arrhenatherum avenaceum	6.	480
Hierochloe borealis	2.	148
Sesleria cœrulea	3.	192
Panicum Crus-galli	6.	462
Setaria verticillata	3.	211
Poa annua	4.	288
Triodia decumbens	6.	488

vol. plate

Briza media	.	2.	104
Dactylis glomerata	.	2.	108
Cynosurus cristatus	.	3.	216
Festuca pratensis	.	5.	324
Bromus mollis	.	5.	348
Avena pubescens	.	4.	292
Arundo phragmites	.	5.	372
Elymus Europæus	.	6.	496
Hordium murinum	.	5.	344
Triticum repens	.	2.	112
Brachypodium pinnatum	.	6.	448
Lolium perenne	.	2.	116
Rottbollia incurvata	.	6.	476
Knappia agrostidea	.	3.	184
Spartina alterniflora	.	3.	203
Cynodon dactylon	.	1.	59
Digitaria sanguinalis	.	5.	332

**Ord. III.—TRIGYNIA. 3 styles.**

Montia fontana	.	3.	196
Holosteum umbellatum	.	4.	299
Polycarpon tetraphyllum	.	2.	155

**Class IV.—TETRANDRIA. 4 sta. (p. 46)**

**Ord. I.—MONOGYNIA. 1 style.**

Dipsacus sylvestris	.	6.	490
Knautia arvensis	.	3.	179
Scabiosa succisa	.	4.	277
Galium verum	.	4.	294
Rubia peregrina	.	2.	135
Asperula odorata	.	1.	46
Sherardia arvensis	.	4.	244
Exacum filiforme	.	5.	400
Plantago major	.	3.	207
Centunculus minimus	.	4.	296
Epimedium alpinum	.	1.	47
Cornus sanguinea	.	2.	114
Parietaria officinalis	.	3.	224
Alchemilla vulgaris	.	4.	280
Isnardia palustris	.	6.	442
Sanguisorba officinalis	.	4.	269

**Ord. II.—DIGYNIA. 2 styles.**

Buffonia annua	.	2.	152
----------------	---	----	-----

**Ord. III.—TETRAGYNIA. 4 styles.**

Ilex aquifolium	.	4.	262
Potamogeton natans	.	5.	350
Ruppia maritima	.	6.	451
Sagina procumbens	.	3.	199
Moenchia erecta	.	6.	460
Tillæa muscosa	.	5.	380
Radiola millegrana	.	3.	188

**Class V.—PENTANDRIA. 5 sta. (p. 48)**

**Ord. I.—MONOGYNIA. 1 style.**

Echium vulgare	.	3.	189
Pulmonaria officinalis	.	2.	102
Lithospermum purpuro-cærulo-			
leum.		4.	301
Symphytum officinale	.	2.	101

	vol.	plate	vol.	plat <sup>e</sup>	
<i>Borago officinalis</i>	1.	66	<i>Meum athamanticum</i>	4. 314	
<i>Lycopus arvensis</i>	1.	21	<i>Critchmum maritimum</i>	4. 261	
<i>Anchusa sempervirens</i>	1.	48	<i>Angelica sylvestris</i>	6. 491

GENERAL ALPHABETICAL INDEX OF THE GENERA, SPECIES,  
AND SYNONYMS.

*The names in CAPITALS are those adopted in this work.—*

*The synonyms are indented.*

	vol.	fol.		vol.	fol.
Abama ossifragum, <i>Gray</i>	3.	186	ALTHÆA officinalis, L.	3.	226
Absinthium vulgare, <i>Ray</i>	5.	339	Althæa Ibiscus, <i>Ger.</i>	3.	226
Acanthium album, <i>Ger.</i>	4.	273	— vulgaris, <i>Ray</i>	3.	226
ACERAS anthropophora, <i>Br.</i>	3.	305	ALYSSUM calycinum, <i>Willd.</i>	6.	510
ACER campestre, <i>L.</i>	2.	98	Alyssum halimifolium,	5.	355
Acer minus, <i>Ray</i>	2.	98	Alyssum maritimum,	5.	355
ACHILLEA Ptarmica, <i>L.</i>	1.	36	Alyssum minimum, <i>L.</i>	5.	355
Achillea sylvestris, <i>Gray</i>	1.	36	Alyssum sativum, <i>Sm.</i>	6.	447
Achyrophorus radicatus, <i>Sc.</i>	6.	406	Amara dulcis, <i>Ger.</i>	2.	110
ACTINOS vulgaris, <i>Pers.</i>	6.	479	AMARANTHUS Blitum, <i>L.</i>	6.	482
Acinos multis, <i>Ray</i>	6.	479	Amaranthus minor, <i>Gray</i>	6.	482
— Thymoides, <i>Moech.</i>	6.	479	AMMOPHILA arundinacea, <i>Hos.</i>	6.	408
Aconitum Napellus, <i>L.</i>	2.	87	Ammophila arenaria, <i>Lindl.</i>	6.	408
ACORUS Calamus, <i>L.</i>	5.	330	ANAGALLIS arvensis, <i>L.</i>	1.	29
Acorus undulatus, <i>Gray</i>	5.	330	Anagallis lutea, <i>Ger.</i>	4.	310
ACTEA spicata, <i>L.</i>	3.	218	— mas, <i>Ger.</i>	1.	29
ACTINOCARPUS Damasonium,	6.	437	— phænicaea, <i>Gray</i>	1.	29
Acynos, <i>Ger.</i>	5.	346	ANCHUSA sempervirens, <i>L.</i>	1.	48
ADONIS autumnalis, <i>L.</i>	1.	7	ANDROMEDA polifolia, <i>L.</i>	5.	361
ADOXA moschatellina, <i>L.</i>	1.	42	Andromeda Dabœcia, <i>L.</i>	6.	449
Adoxa tuberosa, <i>Gray</i>	1.	42	ANDROSÆMUM officinale, <i>Gr.</i>	1.	39
Ægilops incurvata, <i>L.</i>	6.	476	ANEMONE nemorosa, <i>L.</i>	1.	43
Ægonychon repens, <i>Gray</i>	4.	301	Anemonanthea nemorosa, <i>Gr.</i>	1.	43
ÆGOPODIUM Podagraria, <i>L.</i>	2.	151	Anethum fœniculum, <i>L.</i>	3.	176
Ægopodium angelicæfolium,	2.	151	ANGELICA sylvestris, <i>Ger.</i>	6.	491
ÆTHUSA cynapium, <i>L.</i>	1.	19	Angelica palustris, <i>Riv.</i>	6.	491
Æthusa Meum, <i>L.</i>	4.	314	Antennaria dioica, <i>Gært.</i>	4.	243
Æthusa tenuifolia, <i>Gray</i>	1.	19	Antennaria montana, <i>Gray</i>	4.	243
AGRIFOLIUM, <i>Ger.</i>	4.	262	ANTHEMIS Cotula, <i>L.</i>	5.	328
AGRIMONIA eupatoria, <i>L.</i>	2.	88	ANTHERICUM serotinum, <i>L.</i>	6.	464
Agrimonia vulgaris, <i>Gray</i>	2.	88	Anthericum calyculatum, <i>L.</i>	3.	227
AGROSTEMMA Githago, <i>L.</i>	3.	175	— ossifragum, <i>L.</i>	3.	186
AGROSTIS alba, <i>L.</i>	6.	492	ANTHOXANTHUM odoratum, <i>L.</i>	2.	99
Agrostis australis, <i>L.</i>	6.	444	ANTHRISCUS sylvestris, <i>Hoffm.</i>	3.	228
— capillaris, <i>Leers</i>	6.	492	ANTHYLLIS vulneraria, <i>L.</i>	5.	397
— lendigera, <i>DC.</i>	5.	444	Anthyllis leguminosa, <i>Ger.</i>	5.	397
— linearis, <i>Willd.</i>	1.	59	ANTIRRHINUM majus, <i>L.</i>	3.	169
— minima, <i>L.</i>	3.	184	Antirrhinum cymbalaria, <i>L.</i>	1.	23
— mutabilis, <i>Knapp.</i>	6.	492	APARGIA hispida, <i>Willd.</i>	4.	318
— panicea, <i>Willd.</i>	3.	208	Apargia hirta, <i>Sm.</i>	5.	323
— polymorpha, <i>Huds.</i>	6.	492	APERINE major Plinii, <i>Ger.</i>	6.	466
— rubra, <i>Huds.</i>	6.	444	APIUM graveolens, <i>L.</i>	2.	156
— stolonifera, var. <i>Sin.</i>	6.	492	AQUILEGIA vulgaris, <i>L.</i>	3.	221
— tri-aristata, <i>Knap.</i>	3.	208	Aquilegia cærulea, <i>Ger.</i>	3.	221
— ventricosa, <i>Gouan.</i>	6.	444	ARARIS Turrita, <i>L.</i>	2.	159
AIRA caryophyllea, <i>L.</i>	6.	416	Arabis major, <i>Gray</i>	2.	159
Aira aquatica, <i>L.</i>	4.	252	AREBUTUS Unedo, <i>L.</i>	6.	497
Ajax fenestrata, <i>Gray</i>	1.	73	Arbutus procumbens, <i>Salis.</i>	6.	502
Ajax festalis, <i>Salis.</i>	1.	73	— serratifolia, <i>Salis.</i>	6.	497
AJUGA reptans, <i>L.</i>	2.	94	— Uva-Ursi, <i>L.</i>	6.	502
ALCHEMILLA vulgaris, <i>L.</i>	4.	280	ARCTIUM Lappa, <i>L.</i>	5.	333
ALISMA Plantago, <i>L.</i>	5.	337	Arctium major, <i>Gray</i>	5.	333
Alisma Damasonium, <i>L.</i>	6.	437	ARCTOSTAPHYLOS Uva-ursi, <i>Sp.</i>	6.	502
— major, <i>Gray</i>	5.	337	ARENARIA verna, <i>L.</i>	5.	384
ALLIUM ursinum, <i>L.</i>	2.	97	Arenaria laricifolia, <i>Lightf.</i>	5.	384
ALNUS glutinosa, <i>Willd.</i>	3.	193	— juniperina, <i>With.</i>	5.	384
Alnus nigra, S. Frangula, <i>Ger.</i>	3.	219	— saxatilis, <i>Huds.</i>	5.	384
ALOPECURUS pratensis, <i>L.</i>	1.	45	ARISTOLOCHIA Clematitis, <i>L.</i>	1.	28
Alopecurus genuina, <i>Mor.</i>	4.	256	Aristolochia infesta, <i>Gray</i>	1.	28
— aristatus, <i>With.</i>	3.	208	— saracenica, <i>Ger.</i>	1.	28
— monspeliensis, <i>L.</i>	3.	208	ARRHENATHERUM avenaceum, <i>6.</i>	480	
— ventricosus, <i>Hud.</i>	6.	444	Arrhenatherum elatius, <i>Gray</i>	6.	480
Alsine baccifera, <i>Ger.</i>	6.	507	ARTEMISIA Absinthium, <i>L.</i>	5.	339

## A LIST OF GENERA

Adopted in Professor LINDLEY's Synopsis of the British Flora,\* with those in which they are included in, or synonymous with, in this work, and in Sir W. J. HOOKER's British Flora, first edition.

<i>Syn. Br. Fl.</i>	<i>Br. Fl.</i>	vol.	fol.
Achnodon	Phleum	1.	68
Achyrophorus	Hypochaeris	6.	446
Agropyrum	Triticum	2.	112
Airochloa	Aira	6.	416
Alliaria	Erysimum	1.	62
Anacampsis	Orchis	3.	213
Anemagrostis	Agrostis	6.	492
Antennaria	Gnaphalium	4.	243
Archangelica	Angelica	6.	491
Armeria	Statice	3.	183
Calystegia	Convolvulus	1.	58
Caprifolium	Lonicera	4.	287
Carrichtera	Vella	6.	420
Catopodium	Triticum	2.	112
Centranthus	Valeriana	2.	90
Cerasus	Prunus	2.	100
Chamagrostis	Knappia	3.	184
Condyllocarpus	Tordylium	6.	443
Conopodium	Bunium	6.	435
Corynephorus	Aira	6.	416
Cytisus	Spartium	1.	77
Deschampsia	Aira	6.	416
Digraphis	Phalaris	1.	56
Diplotaxis	Sinapis	5.	366
Echinocloa	Paeicum	6.	462
Erophila	Draba	1.	38
Filago	Gnaphalium	4.	243
Glyce	Koniga	5.	355
Glyceria	Poa	4.	288
Heleocharis	Eleocharis	6.	436
Heliotiton	Eleocharis	6.	436
Hirculus	Saxifraga	3.	187
Holoschœnus	Scirpus	4.	264
Hydrochloa	Poa	4.	288
Isolepis	Scirpus	4.	264
Kobresia	Elyna	6.	484
Lappa	Arctium	5.	333
Larbrea	Stellaria	2.	154
Leiogyne	Saxifraga	3.	187
Maruta	Anthemis	5.	328
Melissa	Calamintha	6.	486
Molinia	Acinos	6.	479
Neotia	Clinopodium	5.	346
Ophiurus	Melica	2.	144
Oporina	Listera	5.	357
Platanthera	Rottbollia	6.	476
Prismatocarpus	Apargia	4.	318
Robertsonia	Peristylus, B. Habenaria, Hook.		
Römeria	Campanula	1.	61
Schoenodorus	Saxifraga	3.	187
Sclerochloa	Glaucium	2.	131
Silybum	Festuca	5.	324
Trichodium	Poa	4.	288
Trigonella	Carduus	3.	177
Trisetum	Agrostis	6.	492
Umbilicus	Trifolium	4.	283
Valerianella	Avena	4.	292
Vulpia	Cotyledon	4.	279
	Fedia	6.	432
	Festuca	5.	324

\* Had I adopted all Professor LINDLEY's genera I could not have completed this work in 6 volumes, or about 500 plates, as, at its commencement in 1832, I promised to do.

## ERRATA.

- Folio 6, line 2, *for MONOGYNIA, read TETRAGYNIA.*  
 Folio 13 a, line 9 from the bottom, *for Lucojum, read Leucojum.*  
 Folio 32, line 3, after *Natural Order*, add *ARALIACEÆ.*  
 Folio 42, line 3, after *Natural Order*, add *ARALIACEÆ.*  
 Folio 56, line 2, *for MONOGYNIA, read DIGYNIA.*  
 Folio 59, line 2, *for MONOGYNIA, read DIGYNIA.*  
 Folio 72, line 3, *for RHINANTHACEÆ, read SCROPHULARINEÆ.*  
 Folio 97, line 15 from the bottom, *for Molly, read Moly.*  
 Folio 103, line 2, *for POLYGYNIA, read PENTAGYNIA.*  
 Folio 143, line 6, *for 385 read 384.*  
 Folio \*181 and 182, line 1, *for WATERLILY, read WATERLILY; and \*181 and 182 a, line 9, for tpye, read type.*  
 Folio 203 a, in cancel, line 15 from the bottom, *for It, read In.—At the bottom of the plate 203, for Spartina stricta, read Spartina alterniflora; and for Twin-spiked, read Alternate-flowered.*  
 Folio 209 a, line 8 from the bottom, *for hybernacula, read herbernaculae.*  
 Folio 239, line 5, *for MONOTROPEÆ, read MONOTROPEÆ.*  
 Folio 247, line 24, *for M'ILLIUM, read M'LIUM.*  
 Folio 263, line 2, *for DIGYNIA, read MONOGYNIA.*  
 Folio 271, bottom line, *for 91, read 38; for 147, read 62; and for 27, read 38.*  
 Folio 279, line 2, *for MONOGYNIA, read PENTAGYNIA.*  
 Folio 306, line 7, *for CARDUA'CEÆ, read ANTHEMIDEÆ; and line 9, for sect. 2, read sect. 3.*  
 Folio 385 a, line 2 from the bottom, *after case add it.*  
 Folio 387. *Platanthera* of LINDLEY'S *Synopsis*, 2nd ed. p. 261, has, by an oversight, been omitted. It differs from *Peristylus* in having a long slender spur, and contains only the Butterfly Orchis, *Habenaria bifolia* of HOOKER'S *British Flora*, in which work, and also in LINDLEY'S *Synopsis*, 1st edit., it is included in the same genus as *Peristylus albidus*, and *P. viridis*. It is the *Orchis bifolia* of LINN. Sp. Pl. p. 1331; of Engl. Bot. t. 22; of CURT. FL. LOND. fasc. 6. t. 65; and of SMITH'S Engl. Fl. v. iv. p. 9.  
 Folio 425, line 2, *for SILICULOSA, read SILIQUOSA.*  
 Folio 454 a, line 3 from the bottom, *for acetosa, read acetosa.*  
 Index, page xiv, line 2, *for 261, read 267.*  
 ——, page xix, line 25, left-hand column, *for 151, read 154.*  
 ——, page xx, line 1, *for 261, read 267.*

## DIRECTIONS TO THE BINDER.

If the work is bound up in six volumes, in the order in which it was published, so that the plates shall follow each other consecutively, then—

Vol. 1.	will contain plates	.	1 to 80	{ There are separate Indexes to each Volume.
Vol. 2.	.	.	81 to 160	
Vol. 3.	.	.	161 to 240	
Vol. 4.	.	.	241 to 320	
Vol. 5.	.	.	321 to 400	
Vol. 6.	.	.	401 to 509	

If arranged according to either of the Systematic Indexes, it may be divided into five volumes, thus—

Linnæan Method. (See Index, p. xiii.)

Vol. 1.	MONANDRIA	to	TETRANDRIA.
Vol. 2.	PENTANDRIA	only.	
Vol. 3.	HEXANDRIA	to	POLYANDRIA.
Vol. 4.	DIDYNAMIA	to	POLYADELPHIA.
Vol. 5.	SYNGENESIA	to	POLYGAMIA.

Natural Method. (See Index, p. xviii.)\*

Vol. I.	RANUNCULACEÆ	to	LEGUMINOSÆ.
Vol. 2.	AMYDALEÆ	to	STELLATEÆ.
Vol. 3.	VALERIANÆ	to	SOLANEÆ.
Vol. 4.	OROBANCHEÆ	to	CONIFERÆ.
Vol. 5.	ALISMACEÆ	to	CYPERACEÆ.

A Dedication to follow the Title-page of each volume.

The text (203) for SPARTINA ALTERNIFLORA, to be substituted for that of (203) SPARTINA STRICTA; and the lines to THE CHERWELL WATERLILY (\*181 & 182), given in Vol. 4, to follow the account of the *Nymphaea alba*, or *White Waterlily* (181 & 1802), in Vol. 3.

List of Books referred to, General Indexes, &c., at the end of the last Volume.

\* This arrangement, with only one or two exceptions, is the same as that adopted by Sir W. J. HOOKER, in the fifth edition of his "British Flora," published in 1842.
